The 1st step toward protecting your control system against malware infection and cyber-attack is to incorporate the Endpoint Security Service.

The threat of cyber-attack through unauthorized access or malware infection that targets vulnerable control systems via USB storage devices is increasing on a daily basis. By incorporating the “Endpoint” services on your Windows PCs or Servers, it will protect against such threats and mitigate any risks. Yokogawa Endpoint Security Service will mitigate security risks at the users “Endpoint” and will help to support the sustainability and health of the control system throughout your plant’s lifecycle.

To assume that everything will “probably be OK” may not be adequate as the risk to security increases every day. In order to evaluate the potential security risk objectively we encourage you to adopt the Security Risk Assessment with Yokogawa and determine the best solution to fit your needs.
