* SF6□□-MCW software applications are released as unified multi-lingual products.
* SF51□, SF610, SF620, SF661-ECW and SF662-ECW are transferred to GS 34M06N01-99E.
General
The SF630-MCW FA-M3 Programming Tool WideField3 for the FA-M3 sequence CPU modules allows a user to create and debug programs, as well as manage applications.
With even better support for program reuse and the new script language, it dramatically increases programming efficiency.
And The Live Logic Analyzer function for High-speed applications debugging can slash debug time. **1

Features

- **General**
  - WideField3 is downward compatible with WideField (SF610) and WideField2 (SF620).
  - Multiple copies of WideField3 can run concurrently.
  - Windows 8 (x86/x64 version) **1**, 7 (x86/x64 version) and Vista (x86/x64 version) are supported.
  - WideField3 can be toggled between English and Japanese language modes.

- **Operation**
  - Screen display, current folder and other settings can be restored, removing the need to re-configure after startup.
  - All tag name definition data can be edited in one window.
  - Menus support customizable shortcut keys.

- **Communication Functions**
  - Online connection between a PC and FA-M3 can be established via USB*, RS-232C, Ethernet or FL-net (OPCN-2).
  - Online connection can be made with multiple FA-M3 units using multiple transmission paths.

  *: USB connection is only supported by F3SP66-4S, F3SP67-6S, F3SP71-4N, F3SP76-7N, F3SP71-4S and F3SP76-7S.

**1: New function of version 3 (R3)
● Data Exchange with Other Applications
- Circuits can be pasted to other Windows applications.
- Tag names and I/O comments can be copied and pasted between Microsoft Excel and WideField3.
- Tag name definitions, I/O comments, circuits in programs and subcomments can be exported to and imported from files.
- Results of sampling trace can be generated in Microsoft Excel format for conversion to graphs.
- Device data edited in WideField3 can be exported in Microsoft Excel format.

Effective use of MS Excel
Use of Cut and Paste facilitates transfer of tag definitions to design documents.

● Program Reuse and Advanced Programming
- Supports programming using BASIC-like script language.
- Script code and mnemonic instructions can be combined in programs.
- Branching and looping using control statements, complex computations and text processing can be implemented easily using script language.

- Ladder program edit windows can be customized to display more information for efficient programming.
- Supports modular programming using function blocks. Blocks can be shared and reused as a library.
- Frequently used circuits can be registered as macros and shared with other developers in a library. Macros can be used as input conditions.
- Local devices can be used in blocks and component macros. Blocks coded using local devices can be reused in other projects without modification.
- Structure data format is supported. Structure data can be used to interface with macros and be used in arrays.
- Programs can be compared in ladder view for much easier management.

- Both index modification by a constant and indirect designation are supported.
- Supports program design by tag names. Programs can be created before terminals are allocated. Up to 70,000 tag names and I/O comments in multiple blocks and component macros can be collectively managed.
- Individual blocks can be configured to refer to block tag name definitions, instead of common tag name definitions.
- Tag name definitions can be included in cut, copy and paste operations.
- All tag names used in circuits can be collectively read; all tag names not used in circuits can be collectively deleted.
- Changes in installed positions of I/O modules can be implemented over all blocks of a project with a single operation.
- Definition of constant values using constant names*
- Editing, downloading and uploading of CPU properties*
- Use of M3 escape sequence codes in constant values*
- Programs in CADM3 (SF510) format can be opened.
- Saving and opening of data files of SD card format containing project data*
- Up to 80 characters are available in file name.**1

*: Only supported by CPU modules F3SP66-4S, F3SP67-6S, F3SP71-4N, F3SP76-7N, F3SP71-4S and F3SP76-7S.

● Installation
- Environment settings of the previous version can be inherited when a new version is first installed.

**1: New function of version 3 (R3)
Visibility
- The project window gives a clear view of the program structure and allows any block to be directly opened from the window.
- The Index View can be configured to display only the required circuits. Displaying only circuit comments provides an overall view of the program flow. Circuits can also be printed in index view.
- Up to 16 characters are allowed for tag names. Allows switching between tag name and address display.
- Circuits can be enlarged or reduced in the display.
- Color of circuits, window background, devices (local or global), comments, undefined tag names, constant names, as well as font size and type are customizable.
- Errors in tag name definitions and constant definitions are highlighted in the display.
- TIP help function can be used to view the I/O comment and address allocated to a tag name in a circuit.
- Syntax checking checks detailed program data.
- Individual parameter information is displayed in the instruction parameter input dialog.
- Free-format balloon comments can be pasted freely on circuits. Devices can be specified within balloon comments for monitoring anywhere.
  You can store balloon comments in the CPU.
- Edit windows can be split to view and edit two distant parts of the same program.
- Ranges of IL-ILC, FOR-NEXT and other paired instructions are easily visible.
- Return numbers in continuation lines are shown.

Program Management
- Project edit history displays recently used files and allow a project to be started.
- A rich set of program management functions are provided to compress and save a project, split and save a project in multiple files, and restore a compressed project.
- An edited project can be saved with a different name.
- When a project is closed, project settings, blocks, and other configurations can be saved at the same time.

Help
- Easy retrieval of context-sensitive help
- Help on instructions including usage and operation
- Help on functions including overview and usage
- Help on errors including causes and troubleshooting
- Selection of instruction from an instruction list
- Instruction manuals in PDF file format

Debugging and Maintenance
- Programs can be monitored and edited online.
- Circuits can be commented out and disabled.
- Commented out parts can be searched collectively.
- Operation status of the system can be managed in user logs. Various types of comments and tag name definitions can be stored in the CPU.
- Supports downloading and uploading of selected blocks and macros.
- Devices can be monitored on tag name definition window images.
- Register values of advanced function modules can be monitored and modified. Display formats and comments can be created and displayed for individual registers.
- Devices can be registered for monitoring, up to 256 devices for each project.
- Powerful sampling trace facilitates analysis of CPU operation.
- Real-time tracing in High-speed applications by Live Logic Analyzer function.*

- Watch monitoring can be used. Devices are automatically displayed in accordance with the visible area of the program monitor, allowing such devices to be monitored.
- Circuit comments and subcomments can be added during online editing.
- Tag name definitions can be downloaded during RUN.

*1: Only supported on F3SP□□□□□□□□□□ CPU modules.
*3: Only supported on F3SP□□□□□□□□□□ CPU modules.
*4: Only supported on F3SP□□□□□□□□□□ R3 or later CPU modules.
**1: New function of version 3 (R3)

Cable for PC Connection

A cable is required to connect a personal computer to the programming tool connector (PROGRAMMER port or USB port) on an FA-M3 CPU module. Select the appropriate cable for the PC to be used as follows.

USB Connection

Procure a commercially available USB cable.
- For F3SP66-4S, F3SP67-6S:
  CPU port uses USB Series B connector.
- For F3SP71-4N, F3SP76-7N, F3SP71-4S, F3SP76-7S:
  CPU port uses USB Series mini B connector.

RS-232C Connection

Model and Name:
KM-11-2T, -3T, -4T Programming Tool Cable
  (for PC/AT-compatible computer)
KM13-1N, -1S USB-serial converter

Note 1: For details on cables for connecting personal computers, see GS34M06C91-01E.
Note 2: RS-232C connection is not available for F3SP66-4S, F3SP67-6S, F3SP71-4N, F3SP71-4S, F3SP76-7N and F3SP76-7S.
**General Specifications**

**SF661-MCW**
FA-M3 ToolBox for Temperature Control and Monitoring Modules R6

---

### General

The FA-M3 ToolBox for Temperature Control and Monitoring Modules is a configuration tool for the Temperature Control and PID Module (F3CU04-0□, F3CU04-1□) and the Temperature Monitoring Module (F3CX04-0□). It allows a user to configure parameters and test module operation. By supporting graphical configuration and monitoring, it simplifies and speeds up the often tedious and time-consuming parameter setup and tuning necessary for successful production operation.

- The FA-M3 ToolBox for Temperature Control and Monitoring Module software is released as a unified multi-lingual product starting from revision R6.01. For details on older versions, refer to the general specification (GS) for SF661–ECW.

### Features

- **Reuse of setup information**
  - Parameter setup information can be utilized among different modules.
- **Powerful debugging and data logging**
  - Action monitoring, error information display, and parameter checking are available even during action test.
  - Module data is automatically logged and stored to a PC.
  - Logged data can be exported for documentation, analysis or processing.
- **Interaction with other applications**
  - The FA-M3 Programming Tool WideField2 or WideField3 and the ToolBox can run concurrently on the same PC for program and parameter editing.
  - Parameter values and log data can be saved as csv-format data.
- **Easy to edit**
  - Parameter editing screens show help information for easier setting of module parameters.
  - Parameter editing screens can be customized so that only necessary parameters are displayed for easier monitoring and editing.
- **Functions added in R3**
  - New communication means via FL-net added to allow connection via FL-net V2.00 using FL-net Interface Modules (F3LX02-1N) version 01.00 or later.
- **Functions added in R4**
  - USB connection between ToolBox and FA-M3, which supports all functionalities available with other communications media;
    - Note: Only supported by CPU modules F3SP66-4S, F3SP67-6S, F3SP71-4N and F3SP76-7N.
  - Upper and lower limits can be defined for logged data.
  - Values of data registers and file registers of a destination CPU module can be selected for logging.
  - Action monitor screens can be enlarged or reduced.
  - Support for Temperature Control and PID Modules F3CU04-0S and F3CU04-1S is added.
  - Module type of a parameter data file can be changed.
  - Support for Windows Vista (x86 version) is added.
- **Functions added in R5 (Japanese release only)**
  - USB connection between ToolBox and FA-M3, which supports all functionalities available with other communications media;
    - Online connection can be made with multiple FA-M3 units using multiple transmission paths.
- **Functions added in R6**
  - Connection to F3SP71-4S and F3SP76-7S.
  - Multilingual support
  - Support for Windows 7 and Vista (x64 version) is added.

### Operating Environment

#### Operating System

- Microsoft Windows 7 (x86/x64)
- Microsoft Windows Vista (x86/x64)
- Microsoft Windows XP
- Microsoft Windows 2000 (English or Japanese OS version)

#### Required Software

- Internet Explorer 5.01 or later

#### Media

- CD-ROM

#### CPU

- Pentium 133 MHz or faster, adequate for the OS to run properly.

#### Memory

- 64MB or larger, adequate for the OS to run properly.

#### Hard Disk Capacity

- 200MB or larger

#### Display

- 800 x 600 dots or higher resolution (1024 x 768 dots recommended)

#### Communications

- USB, RS-232C, Ethernet, FL-net (F3LX02-1N Rev:01.00 or later)

#### Compatible Printer

- A printer that supports A4 size paper and the operating systems above

#### Compatible Modules

- F3CU04-0N, F3CU04-1N, F3CU04-0S, F3CU04-1S, F3CU04-0G, F3CU04-1G, F3CX04-0N, F3CX04-0G

#### CPU Modules

- F3SP05-0P, F3SP08-0P, F3SP21-0N, F3SP22-0S, F3SP25-2N, F3SP28-3N, F3SP28-3S, F3SP35-5N, F3SP38-6N, F3SP38-6S, F3SP53-4H, F3SP53-4S, F3SP58-6H, F3SP58-6S, F3SP59-7S, F3SP66-4S, F3SP67-6S, F3SP71-4N, F3SP71-4S, F3SP76-7N, F3SP76-7S, F3SP76-3N

#### Compatibility with Other Applications

- ToolBox R4 is compatible with WideField2 R1.02 or higher version
- ToolBox R6 supports concurrent communications with WideField3

---

*1: Only the 32-bit (x86) versions but not the 64-bit (x64) versions of Windows XP is supported.

*2: For FL-net communications, CPU speed must be Pentium III 750 MHz or higher.

*3: For FL-net communications, memory must be 128MB or more.

*4: For Ethernet or FL-net communications, the network card must support TCP/IP protocol. Allowable communications conditions vary with CPU type.

*5: USB connection is not guaranteed to work with all PC chipsets and may be unstable when used with some PC chipsets.

*6: F3SP71-4S and F3SP76-7S are compatible only with ToolBox R6.

System Configuration

Cable for PC Connection
A cable is required to connect a personal computer to the programming tool connector (PROGRAMMER port or USB port) on an FA-M3 CPU module. Select the appropriate cable for the PC to be used as follows.

USB Connection
Procure a commercially available USB cable.
- For F3SP66-4S, F3SP67-6S:
  CPU port uses USB Series B connector.
- For F3SP71-4N, F3SP76-7N, F3SP71-4S, F3SP76-7S:
  CPU port uses USB Series mini B connector.

RS-232C Connection
Model and Name:
KM-11-2T, -3T, -4T Programming Tool Cable (for PC/AT-compatible computer)
KM13-1N, -1S USB-serial converter

Note 1: For details on cables for connecting personal computers, see GS34M06C91-01E.
Note 2: RS-232C connection is not available for F3SP66-4S, F3SP67-6S, F3SP71-4N, F3SP71-4N, F3SP76-7N and F3SP76-7S.
General ToolBox for Positioning Module is a Window-based software tool for configuring positioning modules (F3NC32-0N and F3NC34-0N) to perform positioning operations. It can be used to set up registered parameters, action pattern data and position data for positioning modules, as well as perform action test and monitoring.

By providing an integrated development environment that features ease of use, reusability and visibility, it simplifies module setup and debugging, and thus dramatically improves development efficiency.

* The FA-M3 ToolBox for Positioning Modules software is released as a unified multi-lingual product starting from revision R4.01. For details on older versions, refer to the general specification (GS) for SF662-ECW.

Features

ToolBox for Positioning Modules offers the following features.

- **Integrated Development Environment**
  - By installing ToolBox for Positioning Modules (SF662-MCW) and ToolBox for Temperature Control and Monitoring Modules (SF661-MCW) on the same PC, temperature control and PID modules, temperate monitoring modules and positioning modules (with positioning pulse output) can be conveniently managed within the same project.
  - What's more, ToolBox support for other FA-M3 advanced I/O modules can be added when available.

- **Ease of Use and Reusability**
  - Action pattern data and position data are created and managed separately. A user can therefore create action pattern during design, and add position data in the field using the teach function, or even reuse pattern data for different units of the same equipment, thus dramatically improving development efficiency.

ToolBox and the Ladder Programming Tool WideField2 or WideField3 can be run concurrently to edit data. With WideField2 R2 or later version, concurrent communication with FA-M3 is also supported.
- Action pattern table and position data table can be created separately and customized for two-axes operation (F3NC32-0N) and four-axes operation (F3NC34-0N).
- Labels and comments can be added to individual action pattern data or position data records.
- The input completion function speeds up data input by presenting candidates for selection based on existing data during input of action pattern data or position data. This allows a user to create action pattern data or perform action test without prior knowledge of existing action pattern data or position data.

- Action pattern data and position data can be created at the same time or separately to suit your preference.
- Position data can be simply dragged and dropped from the position data table to the action pattern data table.

- **Visibility**
  - The Window List bar displays a list of open windows to allow quick access to hidden windows.

- Cells of setup data are appropriately color-coded on edit windows of registered parameters, action pattern data and position data – red for error data, pink for modified but unconfirmed data, yellow for modified and confirmed value and gray for cells that do not require input.

- **Debugging and Maintenance**
  - All statuses are monitored during an action test to facilitate debugging of registered parameters, action pattern data and position data.

- When performing an action test using jog operations, pressing and holding the SHIFT key moves multiple axes concurrently. Releasing the SHIFT key stops all axes.

- Input/output relays of FA-M3 advanced function I/O modules can be displayed with help information, monitored and even turned on or turned off.

- The Help function in ToolBox for Positioning Module can be used to call up relevant help information in the user manual for positioning modules.
Functions added in R2
- USB connection between ToolBox and FA-M3, which supports all functionalities available with other communications media.
- Support for Windows Vista (x86) version.

Functions added in R3 (Japanese release only)
- Online connection can be made with multiple FA-M3 units using multiple transmission paths.
- Support for Windows 7 (x86) version.

Functions added in R4
- Connection to F3SP71-4S and F3SP76-7S.
- Multilingual support
- Support for Windows 7 and Vista (x64 version) is added.

Function Overview

ToolBox for Positioning Modules (SF662-MCW) is a Windows software tool for configuring positioning modules (F3NC32-0N, F3NC34-0N). It provides an environment for a user to set up registered parameters, action pattern data and position data of positioning modules, as well as perform action test and monitoring. The PC and the FA-M3 can be connected using USB, RS-232C, Ethernet or FL-net.

A user can set up action pattern data and position data for a positioning module using the ToolBox for Positioning Modules software and then executes positioning movements using the pre-stored data.

Positioning can be initiated simply by specifying an action pattern number from the CPU module. Up to four action patterns can be executed concurrently.
1. Screen Layout

(1) Title bar
The title bar shows the name of an open project, an active window, or a file being edited.

(2) Menu bar
The menu bar shows ToolBox standard menu. Clicking a menu item displays a pull down menu showing a list of commands for selection. Available commands depend on the current CPU operating mode and action mode. Unavailable commands are displayed in gray.

(3) Project window
The project window shows a list of execution parameters of an open project and parameters of advanced function modules.

(4) Debugger window
The debugger window shows debug and maintenance information for each registered parameter file.

(5) Toolbar
The toolbar shows icons of frequently used commands for easier access.

(6) Window list bar
The Window List Bar shows icons of open windows in ToolBox.

(7) Action status bar
The action status bar shows the operating status of the FA-M3 system (primarily the CPU module).

(8) Status bar
The status bar indicates the operation status of ToolBox.
2. Screen for Editing Parameters

2.1 Registered Parameters

Clicking the cell of a parameter displays its description.

Displays file name, title and module type.

Displays number and name of axes. Name of axes can be changed from the Properties screen.

Clicking a cell displays a list box or an input helper screen. The cell containing the cursor is displayed with blue background. A cell is displayed with different background colors to indicate different statuses as follows:
- White: Default value
- Yellow: Modified and confirmed value
- Pink: Modified but unconfirmed value
- Red: Invalid value
- Gray: Disregarded value

Saves edited data to file.

Allows changing of title or names of axes.

Saves edited changes and closes the screen.

Cancels editing and closes the screen.

2.2 Action Pattern Data

Edit area
Edit action pattern data. The screen display of this area depends on the action code selected for a record.

Tool Tip for Data List
Displays pattern record no., label and action code.

Data List area
Displays pattern data. You can edit one line at a time.

Data View
Selects data view.

Right mouse click
Click the right mouse button to display this menu.

Up/Down
Moves to the next or previous record.
2.3 Position Data

Tool Tip for Data List
Displays position data no. and label.

Data List area
Displays position data.
You can edit one line at a time.

Right mouse click
Click the right mouse button to display
this menu.

Edit area
Edits position data

Error data are displayed with red
background.

Up/Down
Moves to the next or previous record.

3. Monitor Screen

3.1 Axis Monitor

Current position and current speed

Counter current position
and counter current speed

Error information

Monitors
- Position/speed status
- All axis status
- Error status
- Pattern operation status
- I/O relays

3.2 Pattern Monitor

The pattern being executed is
displayed in blue.

Start/stop monitoring

Displays action pattern data
currently being executed.
4. Action Test Screens

4.1 Jog

Select different tabs to switch between action test screens.

- **Current position and current speed**
- Performs forward or reverse jogging.
- Performs jogging when the mouse button is clicked or while the space key is depressed. Releasing the space key stops jogging.
- To jog multiple axes concurrently, click the mouse button with the [Shift] key depressed. Releasing the [Shift] key stops all axes.
- This button changes to red if any axis error is detected. Clicking the button clears all axis errors.

- **Opens the Teach screen.**
- Specifies the acceleration and deceleration time.

**Select different tabs to switch between action test screens.**

- **Current position and current speed**
- Performs forward or reverse jogging.
- Performs jogging when the mouse button is clicked or while the space key is depressed. Releasing the space key stops jogging.
- To jog multiple axes concurrently, click the mouse button with the [Shift] key depressed. Releasing the [Shift] key stops all axes.
- This button changes to red if any axis error is detected. Clicking the button clears all axis errors.

4.2 Single-axis/Linear Interpolation

Select the test axis.

- **Resets all axis errors; stops positioning movement immediately or after deceleration.**
- **Select the test mode.**
- **Specify the speed, acceleration time and deceleration time.**
- **Specify interpolation axes and target position.** Target position can be specified using existing position data or be entered directly.
- **Performs positioning.**

**Select the test axis.**

- **Resets all axis errors; stops positioning movement immediately or after deceleration.**
- **Select the test mode.**
- **Specify the speed, acceleration time and deceleration time.**
- **Specify interpolation axes and target position.** Target position can be specified using existing position data or be entered directly.
- **Performs positioning.**

**Select the test axis.**

- **Resets all axis errors; stops positioning movement immediately or after deceleration.**
- **Select the test mode.**
- **Specify the speed, acceleration time and deceleration time.**
- **Specify interpolation axes and target position.** Target position can be specified using existing position data or be entered directly.
- **Performs positioning.**

**Select the test axis.**

- **Resets all axis errors; stops positioning movement immediately or after deceleration.**
- **Select the test mode.**
- **Specify the speed, acceleration time and deceleration time.**
- **Specify interpolation axes and target position.** Target position can be specified using existing position data or be entered directly.
- **Performs positioning.**
4.3 Circular or Helical Interpolation

Select the test axis.

Resets all axis errors; stops positioning movement immediately or after deceleration.

Select the test mode.

Specify the speed, acceleration time and deceleration time.

Specify center or sub point.

Performs positioning.

Specify interpolation axes and target position. Target position can be specified using existing position data or be entered directly.

Sets override value.

4.4 Index Positioning

Select the test axis.

Resets all axis errors; stops positioning movement immediately or after deceleration.

Select the test mode.

Performs index positioning.

Specify the target position. Target position can be specified using existing position data or be entered directly.

Specify the speed, acceleration time and deceleration time.

Sets override value.
4.5 Origin Search

Select the test axis.

Select origin search mode.

Sets up parameters for manual origin search.

Performs origin search.

Sets a new current position.

Resets all axis errors; stops positioning movement immediately or after deceleration.

4.6 Manual Pulse Generator/Counter

Select the test axis.

Sets manual pulse generator mode parameters; Starts/stops manual pulse generator mode.

Sets a new counter current position.

Performs counter setup.

Reads absolute encoder data.

Clears counter coincidence detected event.
4.7 Pattern Test

Select the test axis.

Resets all axis errors; stops positioning movement immediately or after deceleration.

Test Operation:
Specify the starting record for pattern operation, and execute pattern operation.
Three modes of operation are available:
- Normal execution
- Restart operation
- Test operation

Sets override value.

Cleans M Code Detected event.

Opens Teach screen.

4.8 Output/Mode

Displays the ON(●)/OFF(○) statuses of general output contacts of each axis. Click an ON or OFF button to turn on or turn off a general output contact.

Switches control mode.
For each axis, the current mode is indicated by a green button. Press a button to switch an axis between position control and speed control mode.
5. Teach Screen

Specify position data record for writing.

Select data to be written:
- current position
- specify value
- counter current position

Displays target position to be written. Enter numeric data if [Specify Value] is selected.

Specify whether to reflect position data to project and module ROM after writing to module.
General

ToolBox for Positioning Module (for F3YP22/24/28) is a Window-based software tool for configuring positioning modules (F3YP22-0P, F3YP24-0P and F3YP28-0P) to perform positioning operations. It can be used to set up registered parameters, position data record and counter for positioning modules, as well as perform action test and monitoring.

By providing an integrated development environment that features ease of use, reusability and visibility, it simplifies module setup and debugging, and thus dramatically improves development efficiency.

* The FA-M3 ToolBox for Positioning Modules software is released as a unified multi-lingual product starting from revision R4.01. For details on older versions, refer to the general specification (GS) for SF662–ECW.

Features

ToolBox for Positioning Modules (for F3YP22/24/28) offers the following features.

- **Integrated Development Environment**
  - By installing ToolBox for Positioning Modules (SF662/663-MCW) and ToolBox for Temperature Control and Monitoring Modules (SF661-MCW) on the same PC, temperature control and PID modules, temperate monitoring modules and positioning modules (with positioning pulse output, with Multi-channel Pulse Output) can be conveniently managed within the same project.
  - What's more, ToolBox support for other FA-M3 advanced I/O modules can be added when available. ToolBox for Temperature Control, for Positioning And Monitoring Modules

- **Ease of Use and Reusability**
  - Position data are created and managed. A user can reuse position data for different units of the same equipment, thus dramatically improving development efficiency.
● Visibility
- The Window List bar displays a list of open windows to allow quick access to hidden windows.

- Cells of setup data are appropriately color-coded on edit windows of registered parameters and position data – red for error data, pink for modified but unconfirmed data, yellow for modified and confirmed value and gray for cells that do not require input.

● Debugging and Maintenance
- All statuses are monitored during an action test to facilitate debugging of registered parameters and position data.

- When performing an action test using jog operations, pressing and holding the SHIFT key moves multiple axes concurrently. Releasing the SHIFT key stops all axes.

- Input/output relays of FA-M3 advanced function I/O modules can be displayed with help information, monitored and even turned on or turned off.

- The Help function in ToolBox for Positioning Module can be used to call up relevant help information in the user manual for positioning modules.

*1: Only the 32-bit (x86) versions but not the 64-bit (x64) versions of Windows XP is supported.

*2: For FL-net communications, CPU speed must be Pentium III 750 MHz or higher.

*3: For Ethernet and FL-net communications, network card must support TCP/IP protocol. Allowable communications conditions vary with CPU type.

*4: USB connection is not guaranteed to work with all PC chipsets and may be unstable when used with some PC chipsets.

Cable for PC Connection
A cable is required to connect a personal computer to the programming tool connector (USB port or PROGRAMMER port) on an FA-M3 CPU module. Select the appropriate cable for the PC to be used as follows.

USB Connection
Procure a commercially available USB cable.
- For F3SP66-4S, F3SP67-6S: CPU port uses USB Series B connector.
- For F3SP71-4N, F3SP76-7N, F3SP71-4S, F3SP76-7S: CPU port uses USB Series mini B connector.

RS-232C Connection
Model and Name: KM-11-2T, -3T, -4T Programming Tool Cable (for PC/AT-compatible computer)
KM13-1N, KM13-1S USB-serial converter

Note 1: For details on cables for connecting PCs, see GS34M06C91-01E.
Note 2: RS-232C connection is not available for F3SP66-4S, F3SP67-6S, F3SP71-4N, F3SP71-4S, F3SP76-7N and F3SP76-7S.

Function Overview

ToolBox for Positioning Modules (SF663-MCW) is a Windows software tool for configuring positioning modules (F3YP22-0P, F3YP24-0P, F3YP28-0P). It provides an environment for a user to set up registered parameters and position data record and counter of positioning modules, as well as perform action test and monitoring. The PC and the FA-M3 can be connected using USB, RS-232C, Ethernet or FL-net.

A user can set up position data record for a positioning module using the ToolBox for Positioning Modules software and then executes positioning movements using the pre-stored data.
1. Screen Layout

(1) Title bar
The title bar shows the name of an open project, an active window, or a file being edited.

(2) Menu bar
The menu bar shows ToolBox standard menu. Clicking a menu item displays a pull-down menu showing a list of commands for selection. Available commands depend on the current CPU operating mode and action mode. Unavailable commands are displayed in gray.

(3) Project window
The project window shows a list of execution parameters of an open project and parameters of advanced function modules.

(4) Debugger window
The debugger window shows debug and maintenance information for each registered parameter file.

(5) Toolbar
The toolbar shows icons of frequently used commands for easier access.

(6) Window list bar
The Window List Bar shows icons of open windows in ToolBox.

(7) Action status bar
The action status bar shows the operating status of the FA-M3 system (primarily the CPU module).

(8) Status bar
The status bar indicates the operation status of ToolBox.
2. Screen for Editing Parameters

2.1 Registered Parameters

Clicking the cell of a parameter displays its description.

Displays file name, title and module type.

Displays number and name of axes. Name of axes can be changed from the Properties screen.

Clicking a cell displays a list box or an input helper screen. The cell containing the cursor is displayed with blue background. A cell is displayed with different background colors to indicate different statuses as follows:
- White: Default value
- Yellow: Modified and confirmed value
- Pink: Modified but unconfirmed value
- Red: Invalid value
- Gray: Disregarded value

Opens Convert Speed screen

Saves edited changes and closes the screen.

Saves edited data to file.

Cancels editing and closes the screen.

2.2 Position Data

Data List area
Displays position data. You can edit one line at a time.

Right mouse click
Click the right mouse button to display this menu.

Edit area
Edits position data

Error data are displayed with red background.

Up/Down
Moves to the next or previous record.
3. Monitor Screen

3.1 Axis Monitor

- Current position and current speed
- Counter current position and counter current speed
- Error information

Monitors:
- Position/speed status
- All axis status
- Error status
- Pattern operation status
- I/O relays
4. Action Test Screens

4.1 Jog

Select different tabs to switch between action test screens.

- **Current position and current speed**: Displays the current position and speed of each axis.
- **Performs forward or reverse jogging**: Jogging allows for movements in either direction. It can be started by clicking the mouse button or depressing the space key, and stopped by releasing the space key.
- **Performs jogging when the mouse button is clicked or while the space key is depressed**: Jogging can be performed while the space key is held down, offering continuous motion.
- **Releasing the space key stops jogging**: To halt jogging, release the space key.
- **To jog multiple axes concurrently, click the mouse button with the [Shift] key depressed**: This feature enables simultaneous jogging across multiple axes.
- **Releasing the [Shift] key stops all axes**: Releases the [Shift] key to stop all axes.
- **Select different tabs to switch between action test screens**: Allows for navigation between different test screens.
- **Sets a new current position**: Enables setting a new position for each axis.
- **Resets all axis errors; stops positioning movement immediately or after deceleration**: Resets any detected axis errors, stopping any positioning movement.

4.2 Origin Search

- **Select the test axis**: Allows selection of the axis to be searched.
- **Resets all axis errors; stops positioning movement immediately or after deceleration**: Resets any detected axis errors, stopping any positioning movement.
- **Select origin search mode**: Enables the selection of the search mode.
- **Sets up parameters for manual origin search**: Allows for the configuration of search parameters.
- **Performs origin search**: Initiates the origin search process.
- **Sets a new current position**: Enables setting a new position for each axis.
4.3 Manual Pulse Generator/Counter

- Select the test axis.
- Resets all axis errors; stops positioning movement immediately or after deceleration.
- Sets manual pulse generator mode parameters; Startups/stops manual pulse generator mode.
- Sets a new counter current position.
- Performs Counter Control Command Request.
- Enables/disables Software Counter.
- Turns ON or turns OFF a Counter Contact Output.

4.4 Position Control

- Select the test axis.
- Resets all axis errors; stops positioning movement immediately or after deceleration.
- Sets target speed.
- Sets Startup speed.
- Sets acceleration time and deceleration time.
- Performs positioning.
- Sets target position.
General Specifications

SF560-ECW BASIC Programming Tool M3 for Windows

General
The SF560-ECW BASIC Programming Tool M3 for Windows is a programming, debugging and CPU environment setting tool for the FA-M3 BASIC CPU modules (F3BP20-0N and F3BP30-0N). This tool makes it possible to create, debug and maintain a program, thus providing an efficient development environment for BASIC programs.

Features

- **Development Environment**
  - The Windows interface offers a comfortable development environment.

- **Debugging Functions**
  - Online edit functions equivalent to a text editor.
  - Data tracing functions allow for prompt detection of variable changes.
  - Incorporates break functions and step operation functions for debugging in functions.

- **CPU Diagnostic Functions**
  - A variety of CPU settings provide support for complicated specifications of applications.
  - Data sharing settings allow for data to be shared with sequence CPU modules.
  - Error logging function allows the tool to store a list of CPU errors.

- **Help Functions**
  - Online reference to functions, statements and commands.
  - Comprehensible examples of errors and measures.
