User’s Manual

Model GX10/GX20/GP10/GP20/GM10

Communication Command User’s Manual

YOKOGAWA
Yokogawa Electric Corporation

IM 04L51B01-17EN
12th Edition
Introduction

Thank you for purchasing the SMARTDAC+ GX10/GX20/GP10/GP20/GM10 Series (hereafter referred to as the recorder, GX, GP, or GM). This manual explains the dedicated commands for the recorder. To ensure correct use, please read this manual thoroughly before beginning operation. For details on the functions related to SMARTDAC+ series options, see also the manual for the options.

Notes

- The contents of this manual are subject to change without prior notice as a result of continuing improvements to the instrument’s performance and functions.
- Every effort has been made in the preparation of this manual to ensure the accuracy of its contents. However, should you have any questions or find any errors, please contact your nearest YOKOGAWA dealer.
- Copying or reproducing all or any part of the contents of this manual without the permission of YOKOGAWA is strictly prohibited.
- The TCP/IP software of this product and the documents concerning it have been developed/created by YOKOGAWA based on the BSD Networking Software, Release 1 that has been licensed from the Regents of the University of California.

QR Code

The product has a QR Code pasted for efficient plant maintenance work and asset information management. It enables confirming the specifications of purchased products and user’s manuals. For more details, please refer to the following URL.
https://www.yokogawa.com/qr-code

QR Code is a registered trademark of DENSO WAVE INCORPORATED.

Trademarks

- SMARTDAC+ and SMARTDACPLUS are registered trademarks of Yokogawa Electric Corporation.
- Microsoft and Windows are registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.
- Adobe and Acrobat are registered trademarks or trademarks of Adobe Systems Incorporated.
- Kerberos is a trademark of Massachusetts Institute of Technology (MIT).
- Bluetooth is a trademark or registered trademark of Bluetooth SIG Inc.
- Company and product names that appear in this manual are registered trademarks or trademarks of their respective holders.
- The company and product names used in this manual are not accompanied by the registered trademark or trademark symbols (® and ™).

How to Use This Manual

This manual explains the dedicated communication commands for the recorder and how to use them. For details on the features of the recorder and how to use it, see the following manuals.

- Model GX10/GX20/GP10/GP20 Paperless Recorder First Step Guide (IM 04L51B01-02EN)
- Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN)
- Data Acquisition System GM First Step Guide (IM 04L55B01-02EN)
- Data Acquisition System GM User’s Manual (IM 04L55B01-01EN)

You can control the recorder by sending commands from a PC over an Ethernet network. There are various types of commands: setting commands, output commands, operation commands, communication control commands, and instrument information output commands.

1.1 Preparing the Instrument

Recorder Configuration
Configure the recorder to connect to the Ethernet network that you want to use. For instructions on how to configure the recorder, see section 1.17, “Configuring the Ethernet Communication Function” in the Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN) or section 2.18, “Configuring the Ethernet Communication Function,” in the Data Acquisition System GM User’s Manual (IM 04L55B01-01EN).

PC
The PC that you will use must meet the following requirements.
- The PC is connected to the Ethernet network that you want to use.
- The PC can run programs that you have created (see section 1.1.2, “Sending Commands and Receiving Responses,” below).

1.1.1 Operations over an Ethernet Network

1.1.2 Sending Commands and Receiving Responses

Programs
When you send a command to the recorder, it will return a response. You can control the recorder by writing a program that sends commands and processes responses and then executing the program. You need to create the programs.
Example: If you send the command “FData,0,0001,0020” from your PC to the recorder, the recorder will return the most recent data of channels 0001 to 0020 in ASCII code. For details on commands and responses, see chapter 2, “Commands and Responses.”

Notes on Creating Programs
- When Not Using the Login Function
  You can start using commands immediately after communication is established with the recorder.
- When Using the Login Function
  Log in to the recorder using a system administrator account or a normal user account that is registered in the recorder. Log in by connecting to the recorder and then sending the “CLogin” command.
- Port Number
  The default port number is “34434.” You can change the port number using the SServer command.
1.2 Operations over the Serial Interface (RS-232, RS-422/485, USB, Bluetooth)

You can control the recorder by sending commands from a PC through the serial interface. There are various types of commands: setting commands, output commands, operation commands, communication control commands, and instrument information output commands. Except for a few special commands, the commands are the same as those used over an Ethernet network.

1.2.1 Preparing the Instrument

Connection

Recorder Configuration

Configure the recorder to use serial communication. For instructions on how to configure the recorder, see section 1.18, “Configuring the Serial Communication Function (/C2 and /C3 options)” in the Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN) or section 2.19, “Configuring the Serial Communication Function (/C3 option),” section 2.20, “Configuring the USB Communication Function,” or section 2.21, “Configuring the Bluetooth Communication Functions,” in the Data Acquisition System GM User’s Manual (IM 04L55B01-01EN).

PC

The PC that you will use must meet the following requirements.

• The PC is connected to the recorder through the serial interface.
• The PC can run programs that you have created (see section 1.2.2, “Sending Commands and Receiving Responses,” below).

1.2.2 Sending Commands and Receiving Responses

Programs

When you send a command to the recorder, it will return a response. You can control the recorder by writing a program that sends commands and processes responses and then executing the program. You need to create the programs.

Example: If you send the command “FData,0,0001,0020” from your PC to the recorder, the recorder will return the most recent data of channels 0001 to 0020 in ASCII code.

For details on commands and responses, see chapter 2, “Commands and Responses.”

Notes on Creating Programs

• For RS-232 (GX/GP), USB communication (GM), Bluetooth (GM, /C8 option)

  When you connect a PC to the recorder through the serial interface, the recorder will be ready to receive commands.

• For RS-422/485

  The device that receives an open command (ESC O) from a PC will be ready to receive commands. The connection will close in the following situations.
  • When the recorder receives a connection-close command (ESC C).
1.2.3 RS-232 Connection Procedure (GX/GP)

Connect a cable to the 9-pin D-sub RS-232 connector.

**Connection**

- **Connector pin arrangement and signal names**

Each pin corresponds to the signal indicated below. The following table shows the signal name, RS-232 standard, JIS, and ITU-T standard signals.

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal Name</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>RD</td>
<td>104</td>
<td>BB(RXD) Received data</td>
</tr>
<tr>
<td>3</td>
<td>SD</td>
<td>103</td>
<td>BA(TXD) Transmitted data</td>
</tr>
<tr>
<td>5</td>
<td>SG</td>
<td>102</td>
<td>AB(GND) Signal ground</td>
</tr>
<tr>
<td>7</td>
<td>RS</td>
<td>105</td>
<td>CA(RTS) Request to send</td>
</tr>
<tr>
<td>8</td>
<td>CS</td>
<td>106</td>
<td>CB(CTS) Clear to send</td>
</tr>
</tbody>
</table>

1 Pins 1, 4, 6, and 9 are not used.

**Signal direction**

- **PC GX/GP**

**Connection example**

- **OFF-OFF/XON-XON**

- **CS-RS(CTS-RTS)**

  The connection of RS on the PC and CS on the GX/GP is not necessary. However, we recommend that you wire them so that the cable can be used in either direction.
Handshaking
When using the RS-232 interface for transferring data, it is necessary for equipment on both sides to agree on a set of rules to ensure the proper transfer of data. The set of rules is called handshaking. Because there are various handshaking methods that can be used between the GX/GP and the PC, you must make sure that the same method is chosen by both the GX/GP and the PC.

You can choose any of the four methods on the GX/GP in the table below.

<table>
<thead>
<tr>
<th>Handshaking</th>
<th>Data transmission control (Control used when sending data to a PC)</th>
<th>Data Reception Control (Control used when receiving data from a PC)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Software Handshaking</td>
<td>Hardware Handshaking</td>
</tr>
<tr>
<td>OFF-OFF</td>
<td></td>
<td></td>
</tr>
<tr>
<td>XON-XON</td>
<td>Yes¹</td>
<td></td>
</tr>
<tr>
<td>XON-RS</td>
<td>Yes¹</td>
<td></td>
</tr>
<tr>
<td>CS-RS</td>
<td>Yes²</td>
<td></td>
</tr>
</tbody>
</table>

Yes Supported.

1. Stops transmission when X-OFF is received. Resume when X-ON is received.
2. Stops sending when CS (CTS) is false. Resumes when it is true.
3. Sends X-OFF when the receive data buffer is 3/4 full. Sends X-ON when the receive data buffer is 1/4 full.
4. Sets RS (RTS) to False when the receive data buffer is 3/4 full. Sets RS (RTS) to True when the receive data buffer becomes 1/4 full.

• OFF-OFF
  Data transmission control
  There is no handshaking between the GX/GP and the PC. The “X-OFF” and “X-ON” signals received from the PC are treated as data, and the CS signal is ignored.

  Data reception control
  There is no handshaking between the GX/GP and the PC. When the receive buffer becomes full, all of the data that overflows are discarded.
  RS = True (fixed).

• XON-XON
  Data transmission control
  Software handshaking is performed between the GX/GP and the PC. When an “X-OFF” code is received while sending data to the PC, the GX/GP stops the data transmission. When the GX/GP receives the next “X-ON” code, the GX/GP resumes the data transmission. The CS signal received from the PC is ignored.

  Data reception control
  Software handshaking is performed between the GX/GP and the PC. When the amount of used area in the received buffer reaches to 3/4 full (192 bytes for R2.01 and earlier; 6144 bytes for R2.02 and later), the GX/GP sends an “X-OFF” code. Then, when the amount of used area decreases to 1/4 bytes (64 bytes for R2.01 and earlier; 2048 bytes for R2.02 and later), the GX/GP sends an “X-ON” code.
  RS = True (fixed).

• XON-RS
  Data transmission control
  The operation is the same as with XON-XON.

  Data reception control
  Hardware handshaking is performed between the GX/GP and the PC. When the amount of used area in the received buffer reaches to 3/4 full (192 bytes for R2.01 and earlier; 6144 bytes for R2.02 and later), the GX/GP sets “RS=False.” Then, when the amount of used area decreases to 1/4 bytes (64 bytes for R2.01 and earlier; 2048 bytes for R2.02 and later), the GX/GP sets “RS=True.”
• **CS-RS**

  **Data transmission control**
  Hardware handshaking is performed between the GX/GP and the PC. When the CS signal becomes False while sending data to the PC, the GX/GP stops the data transmission. When the CS signal becomes True, the GX/GP resume the data transmission. The “X-OFF” and “X-ON” signals are treated as data.

  **Data reception control**
  The operation is the same as with XON-RS.

**Note**
- The PC program must be designed so that the received buffers of both the GX/GP and the PC do not become full.
- If you select XON-XON, send the data in ASCII format.
1.2.4 **RS-422/485 Connection Procedure**

Connect a cable to the terminal.

**Connection**

- **Connecting the Cable**
  
  As shown in the figure below, remove approximately 6 mm of the covering from the end of the cable to expose the conductor. Keep the exposed section from the end of the shield within 5 cm.

![Diagram showing RS-422/485 connection](image)

- **Signal names**
  
  Each terminal corresponds to the signal indicated below.

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>FG</td>
<td>Frame ground of the recorder.</td>
</tr>
<tr>
<td>SG</td>
<td>Signal ground.</td>

</tr>
<tr>
<td>SDA−</td>
<td>Send data A (−).</td>
</tr>
<tr>
<td>RDB+</td>
<td>Receive data B (+).</td>
</tr>
<tr>
<td>RDA−</td>
<td>Receive data A (−).</td>
</tr>
</tbody>
</table>

**Connecting to the host device**

The figure below illustrates the connection of the recorder to a host device. If the port on the host device is an RS-232 interface, connect a converter.

![Diagram showing connection to host device](image)

**Connection example to the host device**

A connection can be made with a host device having a RS-232, RS422, or RS-485 port. In the case of RS-232, a converter is used. See the connection examples below for a typical converter terminal. For details, see the manual that comes with the converter.

<table>
<thead>
<tr>

<tr>
<td>RDB+</td>
<td>RD+</td>
</tr>
<tr>
<td>SG</td>
<td>SHIELD</td>
</tr>
<tr>
<td>FG</td>
<td>EARTH</td>
</tr>
</tbody>
</table>

There is no problem of connecting a 220-Ω terminator at either end if YOKOGAWA's PLCs or temperature controllers are also connected to the communication line.
• **Four-wire system**

Generally, a four-wire system is used to connect to a host device. In the case of a four-wire system, the transmission and reception lines need to be crossed over.

Host device side

<table>

</tbody>
</table>

Do not connect terminators to #1 through #n-1.

• **Two-wire system**

Connect the transmission and reception signals with the same polarity on the RS-422/485 terminal block. Only two wires are used to connect to the external device.

Host device

<th>SG</th>
</tr>
</thead>
<tbody>
<tr>
<td>(SG)</td>
<td>(SG)</td>
<td>(SG)</td>
<td>(SG)</td>
<td>FG</td>
</tr>
</tbody>
</table>

Do not connect terminators to #1 through #n-1.

**Note**

- The method used to eliminate noise varies depending on the situation. In the connection example, the shield of the cable is connected only to the recorder’s ground (one-sided grounding). This is effective when there is a difference in the electric potential between the computer’s ground and the recorder’s ground. This may be the case for long distance communications. If there is no difference in the electric potential between the computer’s ground and the recorder’s ground, the method of connecting the shield also to the computer’s ground may be effective (two-sided grounding). In addition, in some cases, using two-sided grounding with a capacitor connected in series on one side is effective. Consider these possibilities to eliminate noise.

- When using the two-wire interface (Modbus protocol), the 485 driver must be set to high impedance within 3.5 characters after the last data byte is sent by the host computer.
Serial interface converter
The recommended converter is given below.
SYSMEX RA CO.,LTD./MODEL RC-770X, LINE EYE/SI-30FA, YOKOGAWA/ML2

Some converters not recommended by Yokogawa have FG and SG pins that are not isolated. In this case, do not follow the diagram on the previous page (do not connect anything to the FG and SG pins). Especially in the case of long distance communications, the potential difference that appears may damage the recorder or cause communication errors. For converters that do not have the SG pin, they can be used without using the signal ground. For details, see the manual that comes with the converter.

On some non-recommended converters, the signal polarity may be reversed (A/B or +/- indication). In this case, reverse the connection.

For a two-wire system, the host device must control the transmission driver of the converter in order to prevent collisions of transmit and received data. When using the recommended converter, the driver is controlled using the RS (RTS) signal on the RS-232.

When instruments that support only the RS-422 interface exist in the system
When using the four-wire system, up to 32 recorders can be connected to a single host device. However, this may not be true if instruments that support only the RS-422 interface exist in the system.

When YOKOGAWA's recorders that support only the RS-422 interface exist in the system
The maximum number of connection is 16. Some of YOKOGAWA's conventional recorders (HR2400 and µR, for example) only support the RS-422 driver. In this case, only up to 16 units can be connected.

Note

In the RS-422 standard, 10 is the maximum number of connections that are allowed on one port (for a four-wire system).

Terminator
When using a multidrop connection (including a point-to-point connection), connect a terminator to the recorder if the recorder is connected to the end of the chain. Do not connect a terminator to a recorder in the middle of the chain. In addition, turn ON the terminator on the host device (see the manual of the host device). If a converter is being used, turn ON its terminator. The recommended converter is a type that has a built-in terminator.
Select the appropriate terminator (120 Ω), indicated in the figure, according to the characteristic impedance of the line, the installation conditions of the instruments, and so on.
1.2.5 USB Connection Procedure (GM)

The procedure to connect a GM to the PC via USB is shown below. For instructions on how to use the PC, see the user's manual for your PC.

Configuring the GM

Turn the USB communication function on (default value is on). For the procedure, see section 2.19, “Configuring the USB Communication Function,” in the Data Acquisition System GM User’s Manual (IM 04L55B01-01EN).

Connecting the GM to the PC

Connect a USB cable to the USB port.

If the PC is connected to a network environment, a USB driver will be automatically installed. If it does not, check the download link for the driver at our website below, and install the driver.

When the USB driver installation is complete, a COM port will be assigned.

Connect using the following communication conditions.

• Baud rate: 115200
• Parity: None
• Data length: 8 bits
• Stop bits: 1 bit
• Handshake: Off:Off
1.2.6 Bluetooth Connection Procedure (GM, /C8 option)

The procedure to connect a GM to the PC via Bluetooth is shown below. For instructions on how to use the PC, see the user’s manual for your PC.

Configuring the GM

Turn the Bluetooth function on (default value is on). For the procedure, see section 2.20, “Configuring the Bluetooth Communication Function,” in the Data Acquisition System GM User’s Manual (IM 04L55B01-01EN).

Connecting the GM to the PC

1. Check whether the BT LED in the GM status display area is on. If the LED is off, hold down the GM USER1 key for at least 3 seconds.

   The BT LED in the GM status display area is turns on, the GM enters the connection standby state.

2. Perform a pairing operation from the PC.

   A 6-digit authentication code appears on the GM’s 7 segment LED. Check that this authentication code matches that shown on the PC, and pair the devices. When pairing is complete, a COM port will be assigned.

   **Note**
   The GM stores up to eight entries of pairing information. This information is retained even when the power is turned off. The pairing operation is not necessary in subsequent connections.

3. Perform the operation for connecting from the PC to the GM.

   See “Appendix 7 Bluetooth Communication Connection Flow Chart” and section “2.2.7 How to Use Commands”.
2.1 Command Transmission and Recorder Responses

2.1.1 General Communication
The recorder can work with various applications through the use of commands. The communication that is achieved through commands is referred to as “general communication.”

2.1.2 Command Types and Functions
The following types of commands are available. The first character of command names represents the command type. For example, in the command “SRangeAI,” “S” represents the command type. The second and subsequent characters represent the contents of commands.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation commands</td>
<td>Commands that start with “O.” These commands are used to operate the recorder.</td>
</tr>
<tr>
<td>Example: OSetTime</td>
<td></td>
</tr>
<tr>
<td>Setting commands</td>
<td>Commands that start with “S.” These commands change the recorder settings.</td>
</tr>
<tr>
<td>Example: SRangeAI</td>
<td></td>
</tr>
<tr>
<td>Output commands</td>
<td>Commands that start with “F.” These commands cause the recorder to output measured data and other types of data.</td>
</tr>
<tr>
<td>Example: FData</td>
<td></td>
</tr>
<tr>
<td>Communication Control commands</td>
<td>Commands that start with “C.” These commands control the communication with the recorder.</td>
</tr>
<tr>
<td>Example: CCheckSum</td>
<td></td>
</tr>
<tr>
<td>Instrument information output commands</td>
<td>Commands that start with an underscore. These commands cause the recorder to output its instrument information.</td>
</tr>
<tr>
<td>Example: _MFG</td>
<td></td>
</tr>
</tbody>
</table>

2.1.3 Command Syntax
A Single Command
A single command consists of a command name, parameters, delimiters, and terminator. The command name is written in the beginning, and parameters follow. Delimiters are used to separate the command name from parameters and between each parameter. A delimiter is a symbol that indicates a separation. A terminator is attached to the end of a command.

Command name, parameter 1, parameter 2 terminator

Example of a Command
SRangeAI, 0001, VOLT, 2V, OFF, -15000, 18000, 0

Commands in a Series (Setting commands only)
You can send multiple setting commands in a series. When writing a series of commands, separate each command with a sub delimiter. A sub delimiter is a symbol that indicates a separation. A terminator is attached to the end of the series. The maximum number of bytes that can be sent at once is 8000 bytes (8000 characters).

Command name, parameter 1, parameter 2; command name, parameter 1 terminator

(Command 1) (Command 2)

Sub delimiter
2.1 Command Transmission and Recorder Responses

Notes on Writing Commands in a Series
- Only setting commands can be written in a series.
- Queries (see the next section) cannot be written in a series.
- If there is an error in one of the commands in a series, the commands before it are canceled, and those after it are not executed.

Example of a Command
SRANGEAI, 0001, VOLT, 2V, OFF, -15000, 18000, 0; SRANGEAI, 0002, SKIP

Queries
Queries are used to inquire the recorder settings. To send a query, append a question mark to the command name or parameter. When the recorder receives a query, it returns the relevant setting as a character string in an appropriate syntax. Queries can be used on some of the available setting and operation commands.

Command name? terminator
Command name, parameter1? terminator

Examples of Queries and Responses

<table>
<thead>
<tr>
<th>Query</th>
<th>Example of Responses</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRANGEAI?</td>
<td>SRANGEAI, 0001, VOLT, 2V, OFF, -20000, 20000, 0</td>
</tr>
<tr>
<td></td>
<td>SRANGEAI, 0002,..................................................................</td>
</tr>
<tr>
<td></td>
<td>..........................................................................................</td>
</tr>
<tr>
<td>SRANGEAI, 0001?</td>
<td>SRANGEAI, 0001, VOLT, 2V, OFF, -20000, 20000, 0</td>
</tr>
</tbody>
</table>

Command Names
A command name is a character string consisting of up to 16 alphanumeric characters. The first character represents the command type.

Notes on Writing Command Names
- Command names are not case sensitive.
- Spaces before the character string are ignored.
Parameters

Parameters are characteristic values that are attached to commands.

Notes on Writing Parameters

- Write parameters in their appropriate order.
- Spaces around and in the middle of parameters are ignored. Exception is the character strings that users specify.
- You can omit the setting command parameters that do not need to be changed from their current settings. If you omit parameters, write only the delimiters.
- If parameters are omitted and there are multiple delimiters at the end of the command, those delimiters can be omitted.

Example: SRangeAI,0001,,,1800,0 terminator

- If parameters are omitted and there are multiple delimiters at the end of the command, those delimiters can be omitted.

Example: SRangeAI,0001,VOLT,2V,,, terminator -> SRangeAI,0001,VOLT,2V

There are two types of parameters: predefined expressions and user-defined character strings.

How to Write User-Defined Character Strings (Parameters)

- Enclose user-defined character strings in single quotation marks.

Example

The command for setting the channel 0001 tag to “SYSTEM1” is shown below.

STagIO,0001,'SYSTEM1'

- There are two types of user-defined character strings depending on the type of characters that can be used.

Character Strings Consisting Only of Characters in the ASCII Code Range (0x00 to 0x7f)

In this manual, applicable parameters are indicated with “ASCII.”

Example

p3 Tag number (up to 16 characters, ASCII)

You can use alphanumeric characters and some of the symbols. For the ASCII characters that you can use, see appendix 1.

Character Strings Consisting of Characters in the UTF-8 Code Range

In this manual, applicable parameters are indicated with “UTF-8.”

Example

p2 Tag (up to 32 characters, UTF-8)

UTF-8 codes include ASCII codes. You can use UTF-8 characters, including the ASCII characters above. For the ASCII characters that you can use, see appendix 1.

Delimiters

Commas are used as delimiters.

Sub delimiters

Semicolons are used as sub delimiters.

Terminators

“CR+LF” is used as a terminator, meaning “CR” followed by “LF.” Expressed in ASCII code, it is 0x0d0x0a.
2.1.4 Recorder Responses

The recorder returns the following responses to commands.

- If the recorder successfully completes the processing of a received output request command, it outputs the requested data.
- If the recorder successfully completes the processing of a received command that is not an output request command, it outputs an affirmative response.
- If a command syntax error, setting error, or other error occurs, the recorder outputs a negative response.

For each command the recorder receives, it returns a single response. The controller (PC) side must process commands and responses in accordance with this command-response rule. If the command-response rule is not followed, the operation of the recorder is not guaranteed. For details on the response syntax, see 2.9 Responses to Commands.
2.2 List of Commands

Unless specified otherwise, AI, AO, DI, DO, PI, and PID represent I/O channel types.
- AI  Analog input
- AO  Analog output
- DI  Digital input
- DO  Digital output
- PI  Pulse input
- PID PID control

2.2 List of Commands

**Control Operation Parameter Setting Commands**

- **SCtrlSpritAO**: Split computation of the AO terminal of the PID control module
- **SCtrlOutput**: Output process
- **SCtrlRangePV**: Control PV input range
- **SCtrlPVSwitch**: Input switching PV value for PV switching
- **SCtrlCalc**: Reference source of EXPV and RSP
- **SCtrlFilterSP**: Remote SP filter
- **SCtrlRangePV**: Control PV input range
- **SCtrlPVSwitch**: Input switching PV value for PV switching
- **SCtrlCalc**: Reference source of EXPV and RSP
- **SCtrlFilterSP**: Remote SP filter
- **SCtrlOutput**: Output process
- **SCtrlRangePV**: Control PV input range
- **SCtrlPVSwitch**: Input switching PV value for PV switching
- **SCtrlCalc**: Reference source of EXPV and RSP
- **SCtrlFilterSP**: Remote SP filter
- **SCtrlErrPreOut**: Preset output value for input errors
- **SCtrlOutLimit**: Releasing of the output limiter function in manual mode

**Control Display Setting Commands**

- **SCtrlBackColor**: Background color [GX/GP]
- **SCtrlOutOperate**: OUT value manual output operation type
- **STagIO**: PID control module channel display (tag, tag No.)
- **SCtrlOutOfRange**: PID control module channel display (color)
- **SZoneIO**: PID control module channel display (zone high limit, zone low limit)
- **SRemoteSP**: PID control module channel display (scale display position, number of scale divisions)
- **SBarIO**: PID control module channel display (bar display position, number of bar divisions)
- **SPartial**: PID control module channel display (partial)
- **SValueIO**: PID control module channel display (upper and lower limit string)

**Program Control Setting Commands**

- **SPrgColor**: Loop color
- **SPrgDispDetail**: Auto message printing, screen switching

**Control Event Action Setting Commands**

- **SCtrlEventAct**: Control event action

**Logic Math Setting Commands**

- **SLogicMath**: Logic math expression
- **SWConst**: Variable constant

### 2.2.2 Output Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description (Required Options)</th>
<th>Applicable Models</th>
</tr>
</thead>
<tbody>
<tr>
<td>FData</td>
<td>Outputs the most recent channel data</td>
<td>2-94</td>
</tr>
<tr>
<td>FRelay</td>
<td>Outputs the most recent relay and internal switch status</td>
<td>2-94</td>
</tr>
<tr>
<td>FTransStatAO</td>
<td>Outputs the most recent retransmission (AO channel) status</td>
<td>2-94</td>
</tr>
<tr>
<td>FFifoCur</td>
<td>Outputs channel FIFO data</td>
<td>2-94</td>
</tr>
<tr>
<td>FSnap</td>
<td>Takes a snapshot [GX/GP]</td>
<td>2-95</td>
</tr>
<tr>
<td>FUsr</td>
<td>Outputs the user level</td>
<td>2-95</td>
</tr>
<tr>
<td>FAddr</td>
<td>Outputs the IP address</td>
<td>2-95</td>
</tr>
<tr>
<td>FStat</td>
<td>Outputs the GX/GP status</td>
<td>2-95</td>
</tr>
<tr>
<td>FLog</td>
<td>Outputs the log</td>
<td>2-95</td>
</tr>
<tr>
<td>FEventLog</td>
<td>Outputs a detail event log ([AS])</td>
<td>2-96</td>
</tr>
<tr>
<td>FMedia</td>
<td>Outputs external storage medium and internal memory information</td>
<td>2-96</td>
</tr>
<tr>
<td>FCnf</td>
<td>Outputs setting data</td>
<td>2-97</td>
</tr>
<tr>
<td>FChInfo</td>
<td>Outputs decimal place and unit information</td>
<td>2-98</td>
</tr>
<tr>
<td>FSysConf</td>
<td>Queries the system configuration and reconfigures modules</td>
<td>2-98</td>
</tr>
<tr>
<td>FBTDevInfo</td>
<td>Bluetooth device information output ([C8] [GM])</td>

</tr>
<tr>
<td>OtransAllAO</td>
<td>Collective re-transmission output (AO channel) control</td>
<td>2-108</td>
</tr>
<tr>
<td>OCmdAO</td>
<td>Manual output setting</td>
<td>2-108</td>
</tr>
<tr>
<td>OInitPara</td>
<td>Individual setting parameter initialization</td>
<td>2-108</td>
</tr>
<tr>
<td>OCtrlAM</td>
<td>Auto/manual/cascade operation switching</td>
<td>2-109</td>
</tr>
<tr>
<td>OCtrlSR</td>
<td>Operation start/stop switching</td>
<td>2-109</td>
</tr>
<tr>
<td>OCtrlRL</td>
<td>Remote/local switching</td>
<td>2-109</td>
</tr>
<tr>
<td>OCtrlAT</td>
<td>Auto-tuning request</td>
<td>2-109</td>
</tr>
<tr>
<td>OCtrlSPN</td>
<td>Selects the target setpoint number</td>
<td>2-109</td>
</tr>
<tr>
<td>OCtrlLMO</td>
<td>Sets the manual output setpoint</td>
<td>2-110</td>
</tr>
<tr>
<td>OCtrlPAT</td>
<td>Pattern number switching</td>
<td>2-110</td>
</tr>
<tr>
<td>OCtrlMode</td>
<td>Program operation start or stop</td>
<td>2-110</td>
</tr>
<tr>
<td>OCtrlHOLD</td>
<td>Hold operation</td>
<td>2-110</td>
</tr>
<tr>
<td>OCtrlADV</td>
<td>Advance operation</td>
<td>2-110</td>
</tr>
<tr>
<td>OCtrlSP</td>
<td>Sets the target setpoint</td>
<td>2-110</td>
</tr>
<tr>
<td>OCtrlTSP</td>
<td>Sets the final target setpoint</td>
<td>2-111</td>
</tr>
<tr>
<td>OCtrlRTIME</td>
<td>Sets the segment remaining time</td>
<td>2-111</td>
</tr>
<tr>
<td>OCtrlStSeg</td>
<td>Sets the start segment number</td>
<td>2-111</td>
</tr>
<tr>
<td>OCtrlDlyTime</td>
<td>Sets the starting time of program operation</td>
<td>2-111</td>
</tr>
<tr>
<td>OCtrlLoadPAT</td>
<td>Loads a program pattern file</td>
<td>2-112</td>
</tr>
<tr>
<td>OCtrlSavePAT</td>
<td>Saves a program pattern file</td>
<td>2-112</td>
</tr>
<tr>
<td>OCtrlLoadPATAll</td>
<td>Collectively Loads program pattern files</td>
<td>2-112</td>
</tr>
<tr>
<td>OCtrlSavePATAll</td>
<td>Collectively saves program pattern files</td>
<td>2-112</td>
</tr>
<tr>
<td>OCtrlDelPAT</td>
<td>Deletes a pattern file</td>
<td>2-112</td>
</tr>
</tbody>
</table>

### 2.2.5 Communication and Responses

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>OCheckSum</td>
<td>Sets the checksum</td>
<td>2-113</td>
</tr>
<tr>
<td>CSFilter</td>
<td>Sets the status filter</td>
<td>2-113</td>
</tr>
<tr>
<td>CSFilterDB</td>
<td>Sets the status filter (expanded)</td>
<td>2-113</td>
</tr>
<tr>
<td>CLogin</td>
<td>Log in via communication</td>
<td>2-113</td>
</tr>
<tr>
<td>CLogout</td>
<td>Log out via communication</td>
<td>2-113</td>
</tr>
<tr>
<td>CBTConnect</td>
<td>Starts Bluetooth communication ([C8]) [GM]</td>
<td>2-114</td>
</tr>
<tr>
<td>ESC O</td>
<td>Opens an instrument : RS-422/485 command</td>
<td>2-114</td>
</tr>
<tr>
<td>ESC C</td>
<td>Closes an instrument : RS-422/485 command</td>
<td>2-114</td>
</tr>
</tbody>
</table>
### 2.2 List of Commands

#### 2.2.5 Instrument Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>_MFG</td>
<td>Outputs the instrument manufacturer</td>
<td>2-115</td>
</tr>
<tr>
<td>_INF</td>
<td>Outputs the instrument's product name</td>
<td>2-115</td>
</tr>
<tr>
<td>_COD</td>
<td>Outputs the instrument's basic specifications</td>
<td>2-115</td>
</tr>
<tr>
<td>_VER</td>
<td>Outputs the instrument's firmware version information</td>
<td>2-115</td>
</tr>
<tr>
<td>_OPT</td>
<td>Outputs the instrument's option installation information</td>
<td>2-115</td>
</tr>
<tr>
<td>_TYP</td>
<td>Outputs the instrument's temperature unit, and daylight saving time installation information</td>
<td>2-115</td>
</tr>
<tr>
<td>_ERR</td>
<td>Outputs the instrument's error number information</td>
<td>2-115</td>
</tr>
<tr>
<td>_UNS</td>
<td>Outputs the instrument's unit configuration information</td>
<td>2-115</td>
</tr>
<tr>
<td>_UNR</td>
<td>Outputs the instrument's unit configuration information</td>
<td>2-115</td>
</tr>
<tr>
<td>_MDS</td>
<td>Outputs the instrument's module configuration information</td>
<td>2-115</td>
</tr>
<tr>
<td>_MDR</td>
<td>Outputs the instrument's module configuration information</td>
<td>2-115</td>
</tr>
</tbody>
</table>

#### 2.2.6 Conditions for Executing Commands

A command can be executed only when the recorder can execute the setting change or operation that the command specifies. Commands are invalid in the following circumstances:

- The recorder is not in a condition to accept the operation. For example, if the recorder is not recording, you cannot write a message.
- If the recorder does not have the function or is not using the function.
- The "Description" column in section 2.2.1, "Setting Commands" contains the recorder suffix codes that are required for using the commands.
- If the login function is in use, the command cannot be used at the user level that the user is logged in at.
- User restriction is placed on the operation. The following table lists the commands that are invalid according to the limitation types (p1 of the SOpelimit command or p2 of the SUSerlimit command).

<table>
<thead>
<tr>
<th>Limitation Type</th>
<th>Invalid Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory</td>
<td>ORec</td>
</tr>
<tr>
<td>Math</td>
<td>OMath</td>
</tr>
<tr>
<td>DataSave</td>
<td>OExecRec, OMTRest</td>
</tr>
<tr>
<td>Message</td>
<td>OMessage</td>
</tr>
<tr>
<td>Batch</td>
<td>OBatName, OBatComment, OBatText</td>
</tr>
<tr>
<td>AlarmACK</td>
<td>OAlarmAck</td>
</tr>
<tr>
<td>Comm</td>
<td>OEMail, OIPApply, OMBRestore, OSLMPRestore</td>
</tr>
</tbody>
</table>

---

*1 Setting commands except for SHomeKind, SHomeMonitor, SFavoriteKind, SFavoriteMonitor, SMultiPattern, SMultiKind, and SCalib[ON][OFF], SCalibUseCom, SCalibCom (Note) Only when the advanced security function (IAS option) is in use on instruments whose version is 2.02 or later.
*2 Can be specified with the SUSerlimit command when the advanced security function (IAS option) is in use on instruments whose version is 2.02 or later.
*3 Cannot be executed if initialization items include SECURITY or OTHERS items.
*4 Cannot be executed if load items include CALIB items.
*5 Cannot be executed if initialization items include CALIB items.

- The command is not applicable to the model. For commands that can be used only on certain models, the models are listed in the "Description" column in section 2.2.1, "Setting Commands," to section 2.2.4, "Communication Control Commands." (Examples: [GX/GP], [GM]) The applicable models for the following commands are further reduced.

<table>
<thead>
<tr>
<th>Command</th>
<th>Applicable Models</th>
</tr>
</thead>
<tbody>
<tr>
<td>SViewAngle</td>
<td>GX10, GP10</td>
</tr>
<tr>
<td>SMultiPattern</td>
<td>GX20, GP20</td>
</tr>
<tr>
<td>SMultiKind</td>
<td>GX20, GP20</td>
</tr>
</tbody>
</table>
2.2.7 How to Use Commands

When Using Ethernet
- When not using the login function
  When you connect a PC to the recorder, the recorder will be ready to receive commands.
- When using the login function
  Establish communication with the recorder, and log in using a registered user account (CLogin command). After you finish the operation, log out (CLogout command).

When Using RS-232 (GX/GP)
- When you wire and connect a PC to the GX/GP, the GX/GP will be ready to receive commands.
- When using the login function, log in using a registered user account (CLogin command). After you finish the operation, log out (CLogout command).

When Using RS-422/485
- The device that is opened with an open command (ESC o) will be ready to receive commands.
- When using the login function, log in using a registered user account (CLogin command). After you finish the operation, log out (CLogout command).
- To close the connection, send the close command (ESC c).

When Using USB Communication (GM)
- When not using the login function
  When you connect a PC to the GM, the GM will be ready to receive commands.
- When using the login function
  Log in using a registered user account (CLogin command) to establish a connection. After you finish the operation, log out (CLogout command). You can also use the auto logout function (SUsbAutoLOut command).
- To remove a GM, perform a device removal procedure on the PC to disconnect, and then remove the cable.

When Using Bluetooth (GM, /C8 option)
- When not using the login function
  When the Bluetooth password function is enabled, use a command to start communication (CBTConnect) to send the password. When a connection is established, the GM will be ready to receive commands.
- When using the login function
  In addition to the procedure above, log in using a registered user account (CLogin command). After you finish the operation, log out (CLogout command). You can also use the auto logout function (SBTTimeOut command).
- To disconnect, perform a device removal procedure on the PC.

2.2.8 Device Nomenclature in Command Descriptions

The following nomenclature is used in the command descriptions in section 2.4 to distinguish the devices.

<table>
<thead>
<tr>
<th>Nomenclature</th>
<th>Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recorder</td>
<td>Both GX/GP and GM</td>
</tr>
<tr>
<td>Main unit</td>
<td>Both GX/GP and GM main units</td>
</tr>
<tr>
<td>GX/GP main unit</td>
<td>GX/GP main unit</td>
</tr>
<tr>
<td>GM main unit</td>
<td>GM main unit</td>
</tr>
<tr>
<td>GX20-1/GP20-1</td>
<td>GX20/GP20 standard type</td>
</tr>
<tr>
<td>GM10-1</td>
<td>GM10 standard type</td>
</tr>
<tr>
<td>GM10-2</td>
<td>GM10 large memory type</td>
</tr>
<tr>
<td>Expandable I/O</td>
<td>GX/GP Expandable I/O</td>
</tr>
<tr>
<td>Sub unit</td>
<td>GM sub unit</td>
</tr>
</tbody>
</table>

Note
- For the login operation, see appendix 2, “Login Procedure.”
- For details on Bluetooth connection, see appendix 7, “Bluetooth Communication Connection Flow Chart.”
2.3 Parameters

This section describes parameters.

2.3.1 Measuring Range Parameters

AI Channel Span
Specify the span using an integer.
Example: If the range is -2.0000 V to 2.0000 V and you want to set the span lower limit to 0.5000 V and the span upper limit to 1.8000 V, set the parameters to 5000 and 18000, respectively.

Scaling
Scaling is possible on AI and DI channels. Scaling is specified by a mantissa and decimal place.
Example: To set the scaling to -10.00 to 20.00, set the scaling lower limit to -1000, scaling upper limit to 2000, and the decimal place to 2. The decimal place value represents the number of digits to the right of the decimal point.

Math Channel and Communication Channel Span
Set the span of math channels and communication channels using a mantissa and decimal place.
Example: To set the span to 1.000 to 2.000, set the scaling lower limit to 1000, scaling upper limit to 2000, and the decimal place to 3.

2.3.2 Parameter Notation and Range

The table below shows the principle parameter notations and ranges of values.

<table>
<thead>
<tr>
<th>Type</th>
<th>Notation and Range of Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>[GX/GP] Unit number</td>
<td>No expandable I/O 0</td>
</tr>
<tr>
<td></td>
<td>Expandable I/O installed 0 to 6</td>
</tr>
<tr>
<td>[GX/GP] Module number</td>
<td>When the unit is GX10/GP10 0 to 2</td>
</tr>
<tr>
<td></td>
<td>When the unit is GX20/GP20 0 to 9</td>
</tr>
<tr>
<td>[GM] Unit number</td>
<td>No sub unit 0</td>
</tr>
<tr>
<td></td>
<td>Sub unit installed 0 to 6</td>
</tr>
<tr>
<td>[GM] Module number</td>
<td>Main unit 0 to 9</td>
</tr>
<tr>
<td></td>
<td>Sub unit 0 to 6</td>
</tr>
<tr>
<td>AI channel</td>
<td>Specify as &quot;unit number+module number+channel.&quot;</td>
</tr>
<tr>
<td>DI channel</td>
<td>Example: The AI channel whose unit number is 0, module number is 1, and channel number is 02 is 0102.</td>
</tr>
<tr>
<td>DO channel</td>
<td></td>
</tr>
<tr>
<td>PI channel</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Notation and Range of Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>PID channel</td>
<td>Specify as &quot;unit number+slot number+channel.&quot;</td>
</tr>
<tr>
<td></td>
<td>Example: The PID channel whose unit number is 0, slot number is 1, and channel number is 02 is 0102.</td>
</tr>
</tbody>
</table>

Note that the PID channel number changes depending on the channel type. The following table shows the association.

<table>
<thead>
<tr>
<th>Channel type</th>
<th>Channel number (4 digits)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PV</strong></td>
<td>**01, **04</td>
</tr>
<tr>
<td><strong>SP</strong></td>
<td>**02, **05</td>
</tr>
<tr>
<td><strong>OUT</strong></td>
<td>**03, **06</td>
</tr>
<tr>
<td><strong>AI</strong></td>
<td>**07, **08</td>
</tr>
<tr>
<td><strong>AO</strong></td>
<td>**09, **10</td>
</tr>
<tr>

</tbody>
</table>

Math channel
GX20-2/GP20-2: 001 to 200
GX10/GP10: 001 to 050
GM10: 001 to 100
For SGroup and SMailAlarm commands, insert "A" in front.
Example: A001
If the measurement mode is dual interval, the number of channels is halved.

Communication channel
GX10/GP10: 001 to 050
GX20-1/GP20-1: 001 to 300
GX20-2/GP20-2: 001 to 500
GM10-1: 001 to 300
GM10-2: 001 to 500
For SGroup and SMailAlarm commands, insert "C" in front.
Example: C001
If the measurement mode is dual interval, the number of channels is halved.

Number of channels for recording display data
GX10/GP10: 001 to 500
GX20-1/GP20-1: 001 to 1000
GX20-2/GP20-2: 001 to 1000
GM10-1: 1 to 500
GM10-2: 1 to 1000

Number of channels for recording event data
GX10/GP10: 001 to 500
GX20-1/GP20-1: 001 to 1000
GX20-2/GP20-2: 001 to 1000
GM10-1: 1 to 500
GM10-2: 1 to 1000

Number of channels for recording manual sampled data
GX10/GP10/GX20-1/GP20-1: 1 to 50
GX20-2/GP20-2: 2 to 100
GM10-1: 1 to 50
GM10-2: 1 to 100

Number of report channels
GX10/GP10: 1 to 50
GX20-1/GP20-1: 1 to 60
GM10: 1 to 60

Number of display groups
GX10/GP10: 1 to 30
GX20-1/GP20-1: 1 to 50
GX20-2/GP20-2: 1 to 60
GM10-1: 1 to 50
GM10-2: 1 to 60
### Type Notation and Range of Values

<table>
<thead>
<tr>
<th>Type</th>
<th>Notation and Range of Values</th>

GM10-1: 1 to 6          
GM10-2: 1 to 12          |
| Number of control groups          | GX10-1/GX20-1/GM10-1: 1 to 5   
GX20-2/GM10-2: 1 to 10     |
| Loop number                       | L001 to L652                |

**2.3.3 Specifying a Range**

When specifying consecutive channel numbers or group numbers in a setting command, you can specify them using a range instead of specifying each number one by one.

- Use a hyphen to separate the first number and the last number. For I/O channels, you can specify a range that spans over multiple slots that modules are installed in.
- You can specify the minimum number by omitting the number before the hyphen and the maximum number by omitting the number after the hyphen. If you want to specify all numbers from the first number to the last number, specify only the hyphen.

**Example 1**

To specify 3 to 10: “3-10”  
To specify 3 to the maximum number: “3-”  
To specify the first number to 10: “-10”  
To specify all numbers: “-”

**Example 2**

A command that sets the channel ranges of AI modules installed in slots 0 to 2 to Skip.  
SRangeAI,0001-0210, Skip or  
SRangeAI,-0210, Skip  
If a different module is installed in slot 1, queries will work, but setting commands will result in error.
2.4 Setting Commands

SScan

Scan Interval
Sets the scan interval.

Syntax
SScan,p1,p2
  p1  Scan group (1 or 2)
      When the measurement mode is Normal or High speed, this is fixed to 1. When the measurement mode is Dual interval, you can select 1 or 2.
  p2  Scan interval (see “Description”)

Query
SScan{,p1}?

Example
Set the scan interval of scan group 1 to 1 second.
SScan,1,1s

Description
• You cannot use this command to configure settings while recording is in progress.
• You cannot use this command to configure settings while computation is in progress.
• The scan interval (p2) can be set in the following range.

<table>
<thead>
<tr>
<th>Measurement mode</th>
<th>Options (p2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal (Notes *1, *2, *3)</td>
<td>100ms, 200ms, 500ms, 1s, 2s, 5s</td>
</tr>
<tr>
<td>High speed</td>
<td>1ms, 2ms, 5ms, 10ms</td>
</tr>
<tr>
<td>20ms, 50ms, 100ms, 200ms, 500ms, 1s, 2s, 5s</td>
<td></td>
</tr>
<tr>
<td>Dual interval (Notes *4, *5, *6, *7)</td>
<td>1ms, 2ms, 5ms, 10ms</td>
</tr>
<tr>
<td>20ms, 50ms, 100ms, 200ms, 500ms, 1s, 2s, 5s</td>
<td></td>
</tr>
</tbody>
</table>

*1 If an electro-magnetic relay type analog input module is installed, scan interval less than or equal to 500 ms cannot be specified.
*2 If a low withstand voltage relay type analog input module is installed, scan interval less than or equal to 200 ms cannot be specified.
*3 When the multi-batch function (/BT) is enabled, you cannot set the scan interval to 200 ms or less.
*4 If high-speed AI type analog input module is installed, scan interval less than or equal to 50 ms cannot be specified.
*5 If an electro-magnetic relay type analog input module is assigned to a scan group, scan interval less than or equal to 500 ms cannot be specified.
*6 If a low withstand voltage relay type analog input module is assigned to a scan group, scan interval less than or equal to 200 ms cannot be specified.
*7 For dual interval measurement, scan interval cannot be set less than 50 ms on scan group 2.

The following three conditions must be met for an option to be a valid scan interval.

1. When specifying a scan interval of 50 ms or less, the number of channels must be within the limits. (For the limits to the number of channels for each scan interval, see the main unit’s User’s Manual (IM 04L51B01-01EN, or IM 04L55B01-01EN).)

2. When specifying a scan interval of 50 ms or less, the number of channels must be within the limits. (For the limits to the number of channels for each scan interval, see the main unit’s User’s Manual (IM 04L51B01-01EN, or IM 04L55B01-01EN).)

3. The shortest scan interval of the modules assigned to a scan group is shorter than the scan interval of the scan group. The following table shows the shortest scan interval of each module.

<table>
<thead>
<tr>
<th>Module type (type, suffix code)</th>
<th>Shortest scan interval (when installed in the main unit)</th>
<th>Shortest scan interval (when installed in an expandable I/O)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analog input module</td>
<td>1ms, 100ms</td>
<td>100ms, 500ms</td>
</tr>
<tr>
<td>(high-speed AI, -H0)</td>
<td>1ms, 100ms</td>
<td>100ms, 500ms</td>
</tr>
<tr>
<td>(Universal, -U2)</td>
<td>2ms, 200ms</td>
<td>200ms, 1000ms</td>
</tr>
<tr>
<td>(Electromagnetic relay, -T1)</td>
<td>1s, 1s</td>
<td>1s, 1s</td>
</tr>
<tr>
<td>(Low withstand voltage relay, -L1)</td>
<td>500ms, 1s</td>
<td>500ms, 1s</td>
</tr>
<tr>
<td>(Current input, -C1)</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>(4-wire RTD, -R1)</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>(High withstand voltage, -V1)</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>Digital input module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>Digital output module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>Analog output module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>Digital input/output module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>Pulse input module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>Expansion module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
<tr>
<td>PID control module</td>
<td>100ms, 100ms</td>
<td>100ms, 100ms</td>
</tr>
</tbody>
</table>

SScanGroup

Scan Group
Sets the scan group of the module.

Syntax
SScanGroup,p1,p2,p3
  p1  Unit number
  p2  Module number
  p3  Scan group (1)

Query
SScanGroup{,p1[,p2]}?

Example
Set the module installed in the main unit, whose module number is 2 in scan group 1.
SScanGroup,0,2,1

Description
• You cannot use this command to configure settings while recording is in progress.
• You cannot use this command to configure settings while computation is in progress.
• The scan group (p3) can be set in the following range.

<table>
<thead>
<tr>
<th>Measurement mode</th>
<th>Options (p3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal, High speed</td>
<td>Fixed to 1</td>
</tr>
<tr>
<td>Dual interval</td>
<td>1 or 2</td>
</tr>
</tbody>
</table>

The following three conditions must be met for an option to be a valid scan group.

1. For a module installed in the main unit, assign the module to a scan group with a scan interval of 50 ms or less.
2. If the scan interval is 50 ms or less, the number of installed modules and the number of channels must be within their limits.
3. The shortest scan interval of the module must be shorter than the scan interval of the scan group.

### SModeAI

**AI Module**
Sets the mode and A/D integration time or noise rejection mode of an AI module (excluding current input type AI modules).

**Syntax**
```
SModeAI,p1,p2,p3,p4
```
- **p1**: Unit number
- **p2**: Module number
- **p3**: Mode (see “Description.”)
- **p4**: A/D integration time or noise rejection mode
  - A/D integration time: Auto, 50Hz, 60Hz, Common
  - Noise rejection mode (high-speed AI type): Off, 50Hz, 60Hz, Common

**Query**
```
SModeAI[,p1[,p2]]?
```

**Example**
For the module installed in the main unit, whose module number is 2, set the mode to 10CH and the AD integration time to Auto.
```
SModeAI,0,2,10CH,Auto
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- Scan intervals shorter than 1 s cannot be specified if an electro-magnetic relay type (Type suffix code: -T1) analog input module is in use (set up).
- Channel mode (p3) options vary depending on the module.

<table>
<thead>
<tr>
<th>Module type</th>
<th>Mode (p3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Universal type (-U2)</td>
<td>2CH, 10CH</td>
</tr>
<tr>
<td>Current input type (-C1)</td>
<td></td>
</tr>
<tr>
<td>High withstand voltage</td>
<td></td>
</tr>
<tr>
<td>(-V1)</td>
<td></td>
</tr>
<tr>
<td>Electromagnetic relay type</td>
<td>10CH</td>
</tr>
<tr>
<td>(-T1)</td>
<td></td>
</tr>
<tr>
<td>Low withstand voltage</td>
<td></td>
</tr>
<tr>
<td>relay type (-L1)</td>
<td></td>
</tr>
<tr>
<td>4-wire RTD type (-R1)</td>
<td>2CH, 6CH</td>
</tr>
<tr>
<td>High-speed AI type (-H0)</td>
<td>4CH</td>
</tr>
</tbody>
</table>

- Scan interval, p3, and p4 can be set in the following combinations.

<table>
<thead>
<tr>
<th>Universal, current input, electromagnetic relay, low withstand voltage relay or high withstand voltage type</th>
<th></th>
</tr>
</thead>
</table>

### SModeAICurrent

**Current Input Type AI Module**
Sets the mode and A/D integration time of an current input type AI module.

**Syntax**
```
SModeDICurrent,p1,p2,p3,p4
```
- **p1**: Unit number
- **p2**: Module number
- **p3**: Mode
  - 2CH: 2 channel mode
  - 10CH: 10 channel mode
- **p4**: A/D integration time (Auto, 50Hz, 60Hz, Common)

**Query**
```
SModeDICurrent[,p1[,p2]]?
```

**Example**
For the module installed in the main unit, whose module number is 2, set the mode to 10CH and the AD integration time to Auto.
```
SModeDICurrent,0,2,10CH,Auto
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- There are limitations on the allowable combinations of scan interval and p3 and p4. See the explanation for the SModeAI command.

### 2.4 Setting Commands

#### SBOLmtAI

**Upper and Lower Burnout Limits of AI Module**
Sets the burnout limits for the general signal range of an AI module (excluding current input type AI modules).

**Syntax**
```
SBOLmtAI,p1,p2,p3,p4
```
- `p1`: Unit number
- `p2`: Module number
- `p3`: Lower burnout limit for the general signal range. Percentage of the specified span –20.0 to –5.0% (–200 to –50)
- `p4`: Upper burnout limit for the general signal range. Percentage of the specified span 105.0 to 120.0% (1050 to 1200)

**Query**
```
SBOLmtAI[,p1[,p2]]?
```

**Example**
```
For the module installed in the main unit, whose module number is 2, set the lower burnout limit for the general signal range to -10% and the upper burnout limit for the general signal range to 110%.
SBOLmtAI,0,2,-100,1100
```

**Description**
- This command is invalid for 4-wire RTD modules.
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

#### SBOLmtAlCurrent

**Upper and Lower Burnout Limits of Current Input Type AI Module**
Sets the burnout limits for the general signal range of a current input type AI module.

**Syntax**
```
SBOLmtAlCurrent,p1,p2,p3,p4
```
- `p1`: Unit number
- `p2`: Module number
- `p3`: Lower burnout limit for the general signal range. Percentage of the specified span –20.0 to –5.0% (–200 to –50)
- `p4`: Upper burnout limit for the general signal range. Percentage of the specified span 105.0 to 120.0% (1050 to 1200)

**Query**
```
SBOLmtAlCurrent[,p1[,p2]]?
```

**Example**
```
For the module installed in the main unit, whose module number is 2, set the lower burnout limit for the general signal range to -10% and the upper burnout limit for the general signal range to 110%.
SBOLmtAlCurrent,0,2,-100,1100
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

#### SModeDI

**DI Module**
Sets the mode of a DI module.

**Syntax**
```
SModeDI,p1,p2,p3
```
- `p1`: Unit number
- `p2`: Module number
- `p3`: Mode (Normal, Remote)
  - Normal: DI input
  - Remote: Remote control input

**Query**
```
SModeDI[,p1[,p2]]?
```

**Example**
```
Set the module whose module number is 2 as a remote control input module.
SModeDI,0,2,Remote
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- Only one module can be set to remote. If different modules are set to remote numerous times, the last module will be the remote module.
- For modules installed in an expandable I/O or sub unit, p3 is fixed to Normal.
- Pulse input is valid on products with the math function (/MT option).
- When the measurement mode is set to high speed, p3 is fixed to Remote.

#### SModePID

**PID Control Module**
Sets the integration time and burnout criteria of the PID control module.

**Syntax**
```
SModePID,p1,p2,p3,p4,p5
```
- `p1`: Unit number
- `p2`: Module number
- `p3`: Noise rejection mode (fixed to Common)
- `p4`: Lower limit of burnout set for the general signal range. Percentage of the specified span (–200 to –50)
- `p5`: Upper limit of burnout set for the general signal range. Percentage of the specified span (1050 to 1200)

**Query**
```
SModePID[,p1[,p2]]?
```

**Example**
```
For the module with a module number of 2, set the lower limit of burnout set for the general signal range to -20% and the upper limit of burnout set for the general signal range to 105%.
SModePID,0,2,common,-200,1050
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
### SScaleOver

**Detection of Values That Exceed the Scale**
Sets how to detect measurement over-range.

**Syntax**

```
SScaleOver, p1
```

`/P1` How to detect values that exceed the scale

- `FREE` Assume scale over-range when the measurement range is exceeded.
- `OVER` Assume scale over-range when ±105% of the scale is exceeded.

**Query**

`SScaleOver?`

**Example**

Assume scale over-range when the measurement range is exceeded.

`SScaleOver,FREE`

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- The setting specified with this command is valid if at least one module is installed.

### SMemKeyConfirm

**Record Confirmation Action [GX/GP]**
Sets the record confirmation action.

**Syntax**

```
SMemKeyConfirm, p1
```

`p1` Enable or disable confirmation screen (Off, On)

**Query**

`SMemKeyConfirm?`

**Example**

Show the confirmation screen.

`SMemKeyConfirm, On`

**Description**

- When the multi batch function (/BT) is enabled, this is fixed to On.

### SDispData

**Display Data Recording**
Sets the display data recording mode.

**Syntax**

```
SDispData, p1, p2
```

`p1` Recording interval (5s, 10s, 15s, 30s, 1min, 2min, 5min, 10min, 15min, 20min, 30min, 1h, 2h, 4h, 10h)/div.

`p2` File save interval (10min, 20min, 30min, 1h, 2h, 3h, 4h, 6h, 8h, 12h, 1day, 2day, 3day, 5day, 7day, 14day, 31day)

**Query**

`SDispData?`

**Example**

Set the recording interval to 1 minute and file save interval to 12 hours.

`SDispData, 1min, 12h`

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- You cannot choose a recording interval that is shorter than the scan interval.
- You cannot choose a recording interval that is not an integer multiple of the scan interval.
- File save interval is valid when display data recording is enabled (recording mode of the SMemory command).
- This command is invalid when the measurement mode is set to high speed or dual interval.
## SEventData

**Event Data Recording**
Sets the event data recording mode.

**Syntax**
```
SEventData,p1,p2,p3,p4,p5,p6
```

- **p1**: Scan group (1 or 2)
- **p2**: Recording interval (see “Description.”)
- **p3**: Operation mode
  - **Free**: Starts recording at recording start and stops recording at recording stop.
  - **SingleTrigger**: After a trigger event occurs, the recorder will record for the specified time and stop.
  - **RepeatTrigger**: After a trigger event occurs, the recorder will record for the specified time and stop. Then, the recorder will enter the trigger-wait state.
- **p4**: Data length (2min, 5min, 10min, 20min, 30min, 1h, 2h, 3h, 4h, 6h, 8h, 12h, 1day, 2day, 3day, 5day, 7day, 14day, 31day)
- **p5**: Pre-trigger (0, 5, 25, 50, 75, 95, 100) [%]
- **p6**: Trigger source key (Off, On)

**Query**
```
SEventData[,,p1]
```

**Example**
Record event data in Free mode at a recording interval of 1 second. Separate the data into different files every 2 hours.
```
SEventData,1,1s,Free,2h
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- You cannot choose a recording interval that is shorter than the scan interval.
- You cannot choose a recording interval that is not an integer multiple of the scan interval.
- p1 = 2 is valid when the measurement mode is set to dual interval.
- The recording interval (p2) can be set in the following range.

<table>
<thead>
<tr>
<th>Measurement mode</th>
<th>Options (p2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>100ms, 200ms, 500ms, 1s, 2s, 5s, 10s, 15s, 20s, 30s, 1min, 2min, 5min, 10min, 15min, 20min, 30min</td>
</tr>
<tr>
<td>High speed (Note 1)</td>
<td>1ms, 2ms, 5ms, 10ms, 20ms, 50ms, 100ms, 200ms, 500ms, 1s, 2s, 5s, 10s, 15s, 20s, 30s, 1min, 2min, 5min, 10min, 15min, 20min, 30min</td>
</tr>
<tr>
<td>Dual interval (Note 1)</td>
<td>1ms, 2ms, 5ms, 10ms, 20ms, 50ms, 100ms, 200ms, 500ms, 1s, 2s, 5s, 10s, 15s, 20s, 30s, 1min, 2min, 5min, 10min, 15min, 20min, 30min</td>
</tr>
</tbody>
</table>

1. There are limits to the recording intervals less than or equal to 50 ms depending on the model, scan interval, and number of recording channels (see SRecEvent).

- **Note 1**: Data length (p4) can be set to 2min or 5min when the measurement mode is set to high speed.
- **Note 2**: Data length (p4) can be set to 5min when the measurement mode is set to dual interval.
- **Note 3**: This setting is valid when event data recording is enabled (recording mode of the SMemory command).
- **Note 4**: When the advanced security function (/AS) is enabled, p3 is fixed to Free.
- **Note 5**: When the multi batch function (/BT) is enabled, p3 is fixed to Free.

### Scan interval vs. Recording intervals less than or equal to 50 ms

<table>
<thead>
<tr>
<th>Scan interval</th>
<th>Recording intervals less than or equal to 50 ms</th>
</tr>
</thead>
<tbody>
<tr>
<td>1ms</td>
<td>1ms, 2ms, 5ms, 10ms, 20ms, 50ms</td>
</tr>
<tr>
<td>2ms</td>
<td>2ms, 20ms, 50ms</td>
</tr>
<tr>
<td>5ms</td>
<td>5ms, 20ms, 50ms</td>
</tr>
<tr>
<td>10ms</td>
<td>10ms, 20ms, 50ms</td>
</tr>
<tr>
<td>20ms</td>
<td>20ms</td>
</tr>
<tr>
<td>50ms</td>
<td>50ms</td>
</tr>
</tbody>
</table>

- **Note 6**: There are limits to the recording intervals less than or equal to 50 ms depending on the model, scan interval, and number of recording channels (see SRecEvent).
# SRecDisp

**Channel for Recording Display Data**
Sets the channel for recording display data.

**Syntax**
```
SRecDisp,p1,p2,p3
```
- **p1** Number (see “Description”)
- **p2** Channel type
  - **Off** Do not record display data.
  - **IO** I/O channel
  - **Math** Math channel
  - **Com** Communication channel
- **p3** Channel number

**Query**
```
SRecDisp[,p1]?
```

**Example**
Assign the display data of I/O channel 0005 to number 10 and record.
```
SRecDisp,10,IO,0005
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- You cannot use this command to configure settings when the measurement mode is set to dual interval.
- If p2=Off, you cannot set p3.
- There is a limit to the number of recording channels depending on the recording interval (SDispData command).

<table>
<thead>
<tr>
<th>Recording Interval</th>
<th>Number of Recording Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 s/div</td>
<td>100</td>
</tr>
<tr>
<td>10 s/div</td>
<td>200</td>
</tr>
<tr>
<td>15 s/div or higher</td>
<td>500</td>
</tr>
</tbody>
</table>

For the large memory type (GX20-2/GP20-2/GM10-2), the following table applies.

<table>
<thead>
<tr>
<th>Recording Interval</th>
<th>Number of Recording Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When recording only display data</td>
</tr>
<tr>
<td>5 s/div</td>
<td>200</td>
</tr>
<tr>
<td>10 s/div</td>
<td>500</td>
</tr>
<tr>
<td>15 s/div or higher</td>
<td>1000</td>
</tr>
</tbody>
</table>

- You cannot set a channel more than once.

# SRecEvent

**Channel for Recording Event Data**
Sets the channel for recording event data.

**Syntax**
```
SRecEvent,p1,p2,p3,p4
```
- **p1** Scan group (1 or 2)
- **p2** Number (see “Description”)
- **p3** Channel type
  - **Off** Do not record event data.
  - **IO** I/O channel
  - **Math** Math channel
  - **Com** Communication channel
- **p4** Channel number

**Query**
```
SRecEvent[,p1[,p2]]?
```

**Example**
Assign the event data of I/O channel 0006 to number 11 and record.
```
SEventData,1,11,IO,0006
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p3=Off, you cannot set p4.
- There is a limit to the number of recording channels depending on the recording interval (SEventData command).

<table>
<thead>
<tr>
<th>Recording Interval</th>
<th>Number of Recording Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When recording only event data</td>
</tr>
<tr>
<td>100 ms</td>
<td>100</td>
</tr>
<tr>
<td>200 ms</td>
<td>200</td>
</tr>
<tr>
<td>500 ms or more</td>
<td>500</td>
</tr>
<tr>
<td>1 s or more</td>
<td>1000</td>
</tr>
</tbody>
</table>

- If the recording interval is 50 ms or less, there are limits to the number of recording channels depending on the model and measurement mode.

**High speed**

<table>
<thead>
<tr>
<th>Model</th>
<th>Recording interval</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1ms 2ms 5ms 10ms 20ms 50ms</td>
</tr>
<tr>
<td>GX/GP10</td>
<td>2ch 4ch 10ch 20ch 40ch 100ch</td>
</tr>
<tr>
<td>GX/GP20-1</td>
<td>2ch 4ch 10ch 20ch 40ch 100ch</td>
</tr>
<tr>
<td>GX/GP20-2</td>
<td>10ch 20ch 50ch 100ch 150ch 150ch</td>
</tr>
<tr>
<td>GM10-1</td>
<td>2ch 4ch 10ch 20ch 40ch 100ch</td>
</tr>
<tr>
<td>GM10-2</td>
<td>10ch 20ch 50ch 100ch 150ch 150ch</td>
</tr>
</tbody>
</table>

**Dual interval**

<table>
<thead>
<tr>
<th>Model</th>
<th>Recording interval</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1ms 2ms 5ms 10ms 20ms 50ms</td>
</tr>
<tr>
<td>GX/GP10</td>
<td>- - 5ch 10ch 20ch 50ch</td>
</tr>
<tr>
<td>GX/GP20-1</td>
<td>- - 5ch 10ch 20ch 50ch</td>
</tr>
<tr>
<td>GX/GP20-2</td>
<td>5ch 10ch 25ch 40ch 50ch 50ch</td>
</tr>
<tr>
<td>GM10-1</td>
<td>- - 5ch 10ch 20ch 50ch</td>
</tr>
<tr>
<td>GM10-2</td>
<td>5ch 10ch 25ch 40ch 50ch 50ch</td>
</tr>
</tbody>
</table>

- You cannot set a channel more than once.
- When the measurement mode is set to dual interval and p3 = IO, you can set the channels of only the applicable scan groups.
- If the measurement mode is set to dual interval, p3 = Math and p3 = Com can be specified only on scan groups operating at the master scan interval.
2.4 Setting Commands

### SRecManual

#### Channel for Recording Manual Sampled Data
Sets the channel for recording manual sampled data.

**Syntax**
```
SRecManual,p1,p2,p3
```

- **p1** Number (1 to 50)
- **p2** Channel type
  - **Off** Do not record manual sampled data.
  - **IO** I/O channel
  - **Math** Math channel (/MT)
  - **Com** Communication channel (/MC)
- **p3** Channel number

**Query**
```
SRecManual[,p1]?
```

**Example**
Assign the manual sampled data of I/O channel 0003 to number 2 and record.
```
SRecManual,2,IO,0003
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=Off, you cannot set p3.
- You cannot set a channel more than once.

### SBatch

#### Batch Function
Configures the batch function's basic settings.

**Syntax**
```
SBatch,p1,p2,p3,p4
```

- **p1** Enable or disable (Off, On)
- **p2** Number of lot number digits (Off, 4, 6, 8)
  - **Off** Do not use lot numbers.
  - **4** 4-digit lot number
  - **6** 6-digit lot number
  - **8** 8-digit lot number
- **p3** Auto increment (Off, On)
- **p4** Recording start screen (Comment, TextField)
  - **Comment** Batch comment
  - **TextField** Text field

**Query**
```
SBatch?
```

**Example**
Enable the batch function. Use 4-digit lot numbers. Automatically increment the lot number in the next operation.
```
SBatch,On,4,On,TextField
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- When the multi batch function (/BT) is enabled, p1 is fixed to On.

### STextField

#### Batch Text
Sets a batch text.

**Syntax**
```
STextField,p1,p2,p3
```

- **p1** Field number (1 to 50)
- **p2** Title (up to 20 characters, UTF-8)
- **p3** Character string (up to 30 characters, UTF-8)

**Query**
```
STextField[,p1]?
```

**Example**
For field number 3, set the field title to "OPERATOR" and the character string to "RECORDER1."
```
STextField,3,‘OPERATOR’,‘RECORDER1’
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- This command is valid only when the multi batch function (/BT) is disabled.

### SDirectory

#### Name of Directory to Save Data
Sets the name of the directory to save data.

**Syntax**
```
SDirectory,p1
```

- **p1** Directory name (up to 20 characters, ASCII)

**Query**
```
SDirectory?
```

**Example**
Set the directory name to "DATA0."
```
SDirectory,’DATA0’
```

**Description**
- For the characters that you can use in the directory name (p1), see Appendix 1.
- The following character strings cannot be used for directory names.

<table>
<thead>
<tr>
<th>Character String</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUX</td>
</tr>
<tr>
<td>CON</td>
</tr>
<tr>
<td>PRN</td>
</tr>
<tr>
<td>NUL</td>
</tr>
<tr>
<td>CLOCK</td>
</tr>
<tr>
<td>CLOCK$</td>
</tr>
<tr>
<td>COM0 to COM9</td>
</tr>
<tr>
<td>LPT0 to LPT9</td>
</tr>
</tbody>
</table>

- You cannot use a character string that starts or ends with a period or space for directory names.

### SFileHead

#### File Header
Sets the file header character string.

**Syntax**
```
SFileHead,p1
```

- **p1** File header (up to 50 characters, UTF-8)

**Query**
```
SFileHead?
```

**Example**
Set the file header to "GX_DATA."
```
SFileHead,’GX_DATA’
```

**Description**
- This command is valid only when the multi batch function (/BT) is disabled.
### SFileName

**File Naming Rule**
Sets the file naming rule for data files.

**Syntax**
```
SFileName,p1,p2
```
- **p1** File naming rule
  - Date
  - Serial
  - Batch
- **p2** Specified file name (up to 16 characters, ASCII)

**Query**
```
SFileName?
```

**Example**
```
Set the file naming rule to “Date.” Set the specified file name to “Recorder1_data.”
```
```
SFileName,Date,’Recorder1_data’
```

**Description**
- If the batch setting is disabled (SBatch: p1=Off), you cannot specify p1=Batch.
- For the characters that you can use in the specified file name (p2), see [Appendix 1](#).
- This command is valid only when the multi batch function (/BT) is disabled.

### SMediaSave

**Automatic Data File Saving**
Sets the auto saving of data files to an external storage medium.

**Syntax**
```
SMediaSave,p1,p2
```
- **p1** Auto saving to an external storage medium
  - (GX/GP: Off, On)
  - (GM: Off, On, Fixed to On when the advanced security function (/AS) is enabled and the log in via communication is enabled.)
- **p2** Media FIFO (Off, On)

**Query**
```
SMediaSave?
```

**Example**
```
Enable the auto saving to the external storage medium and media FIFO.
```
```
SMediaSave,On,On
```

### SFileFormat

**Display/Event Data File Format**
Sets the file format of display data files and event data files.

**Syntax**
```
SFileFormat,p1
```
- **p1** File format (Binary, Text)

**Query**
```
SFileFormat?
```

**Example**
```
Create files in text format.
```
```
SFileFormat,Text
```

**Description**
- The types of data that you can set file formats for are display data and event data.
- The file saving methods that the specified file format is applied to are auto saving, saving of unsaved data, manual saving, and FTP data transfer.
- When the advanced security function (/AS) is enabled, p1 is fixed to Binary.
SRangeAI

Measurement Range of AI Channel
Sets the measurement range of an AI channel.

Unused Channels
Syntax  SRangeAI,p1,p2
  p1  Channel number
  p2  Input type (Skip)

Channels Whose Input Type Is DI and No Math
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6
  p1  Channel number
  p2  Input type (DI)
  p3  Range (see “Description.”)
  p4  Calculation type (Off)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999)

Channels Whose Input Type Is Volt, TC, RTD, or OHM and No Calculation
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6,p7
  p1  Channel number
  p2  Input type (Volt, TC, RTD)
  p3  Range (see “Description.”)
  p4  Calculation type (Off)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999) (can be set when p2 is not set to DI)

Delta Channels
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6,p7,p8
  p1  Channel number
  p2  Input type (Volt, TC, RTD, DI, OHM)
  p3  Range (see “Description.”)
  p4  Calculation type (Delta)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999) (can be set when p2 is not set to DI)
  p8  Reference channel number

Scaling Channels
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11
  p1  Channel number
  p2  Input type (Volt, TC, RTD, DI, OHM)
  p3  Range (see “Description.”)
  p4  Calculation type (Scale)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999) (can be set when p2 is not set to DI)
  p8  Decimal Place (0 to 5)
  p9  Scaling lower limit
  p10 Scaling upper limit
  p11 Unit (up to 6 characters, UTF-8)

Unified Signal Input Channels (Input Type Is GS)
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13
  p1  Channel number
  p2  Input type (GS)
  p3  Range (see “Description.”)
  p4  Calculation type (Scale)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999)
  p8  Decimal Place (0 to 5)
  p9  Scaling lower limit
  p10 Scaling upper limit
  p11 Unit (up to 6 characters, UTF-8)
  p12 Low-cut function (Off, On)
  p13 Low-cut point (0 to 50)

Square Root Channels
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13,p14
  p1  Channel number
  p2  Input type (Volt, GS)
  p3  Range (see “Description.”)
  p4  Calculation type (Sqrt)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999)
  p8  Decimal Place (0 to 5)
  p9  Scaling lower limit
  p10 Scaling upper limit
  p11 Unit (up to 6 characters, UTF-8)
  p12 Low-cut function (Off, On)
  p13 Low-cut point (0 to 50)
  p14 Low-cut output (Zero, Linear)

Log Scale (/LG) Channels
Syntax  SRangeAI,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11
  p1  Channel number
  p2  Input type (Volt)
  p3  Range (see “Description.”)
  p4  Calculation type (LogT1, LogT2, LogT3)
  p5  Span lower limit
  p6  Span upper limit
  p7  Bias (–999999 to 999999)
  p8  Decimal place of mantissa (1, 2)
  p9  Scaling lower limit (exponential notation, 1.00E-15 to 1.00E15)
  p10 Scaling upper limit (exponential notation, 1.00E-15 to 1.00E15)
  p11 Unit (up to 6 characters, UTF-8)

Query  SRangeAI[,p1]?

Example  Measure -0.5000 to 1.0000 V on channel 0002.
No scaling. No bias.
SRangeAI,0002,Volt,2V,Off,–5000,10000,0

Description
• You cannot use this command to configure settings while recording is in progress.
• You cannot use this command to configure settings while computation is in progress.
• If p2=TC/RTD/DI/OHM, you cannot specify p4=Sqrt.
• If p2=GS, you cannot specify p4=Off/Delta.
• If p2=DI, you cannot set p7.
• If an electro-magnetic relay type, low withstand voltage relay type or high withstand voltage type analog input module is in use, you cannot specify p2=RTD.
• For 4-wire RTD modules, p2 cannot be set to Volt, TC, GS, or DI. (Only SKIP, RTD, and OHM are selectable.)
• p2 = OHM is valid only for 4-wire RTD modules.

The settable items for p3 are shown below.

<table>
<thead>

1 Valid only for high-speed AI modules
2 Valid only for 4-wire RTD modules

• If p4=LogT1 on a Log scale channel, set the value in the following range.
  - p5<p6
  - p9<p10. The maximum span is 15 decades.
  - If the mantissa of p9 is 1.00, the minimum span is 1 decade.
  - If the mantissa of p9 is not 1.00, the minimum span is 2 decades.

• If p4=LogT2 or LogT3 on a Log scale channel, set the value in the following range.
  - p5<p6
  - p9, p10
  - The maximum span is 15 decades; the minimum is 1 decade.
  - If the mantissa of p9 is not 1.00, the exponent is +14 or less, and the maximum span is 14 decades.

### SRangeAlCurrent

**Measurement Range of Current Input Type Al Channel**

Sets the measurement range of an current input type Al channel.

#### Unused Channels

**Syntax**

SRangeAlCurrent,p1,p2

- p1 Channel number
- p2 Input type (Skip)

#### Channels Whose Input Type is Current and No Math

**Syntax**

SRangeAlCurrent,p1,p2,p3,p4,p5,p6,p7

- p1 Channel number
- p2 Input type (Current)
- p3 Range (0-20mA)
- p4 Math type (Off)
- p5 Span lower limit
- p6 Span upper limit
- p7 Bias (--999999 to 999999)

#### Delta Channels

**Syntax**

SRangeAlCurrent,p1,p2,p3,p4,p5,p6,p7,p8

- p1 Channel number
- p2 Input type (Current)
- p3 Range (0-20mA)
- p4 Math type (Delta)
- p5 Span lower limit
- p6 Span upper limit
- p7 Bias (--999999 to 999999)
- p8 Reference channel number

#### Scaling Channels

**Syntax**

SRangeAlCurrent,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13

- p1 Channel number
- p2 Input type (Current)
- p3 Range (0-20mA)
- p4 Math type (Scale)
- p5 Span lower limit
- p6 Span upper limit
- p7 Bias (--999999 to 999999)
- p8 Decimal place (0 to 5)
- p9 Scaling lower limit
- p10 Scaling upper limit
- p11 Unit (up to 6 characters, UTF-8)

#### Scaling Channels (General Signal 4-20mA Input)

**Syntax**

SRangeAlCurrent,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13

- p1 Channel number
- p2 Input type (GS)
- p3 Range (4-20mA)
- p4 Math type (Scale)
### 2.4 Setting Commands

**Square Root Channels**

**Syntax**
```
SRangeAICurrent, p1, p2, p3, p4, p5, p6, 
p7, p8, p9, p10, p11, p12, p13, p14
```

- **p1**: Channel number
- **p2**: Input type (Current, GS)
- **p3**: Range
  - `0-20mA` When p2 = Current
  - `4-20mA` When p2 = GS
- **p4**: Math type (Sqrt)
- **p5**: Span lower limit
- **p6**: Span upper limit
- **p7**: Bias (–999999 to 999999)
- **p8**: Decimal place (0 to 5)
- **p9**: Scaling lower limit
- **p10**: Scaling upper limit
- **p11**: Unit (up to 6 characters, UTF-8)
- **p12**: Low-cut function (Off, On)
- **p13**: Low-cut point (0 to 50)
- **p14**: Low-cut output (Zero, Linear)

**Query**
```
SRangeAICurrent[, p1]?
```

**Example**
```
Measure 0.000 to 10.000 mA on channel 0002.
No scaling. No bias.
SRangeAICurrent, 0002, Current, 0-20mA, Off, 0, 10000, 0
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=GS, you cannot specify p4=Off/Delta.
- Specify p5 and p6 within the range shown in the following table.

<table>
<thead>
<tr>
<th>Range (p3)</th>
<th>Value (p5, p6)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-20mA</td>
<td>0.000 to 20.000</td>
</tr>
<tr>
<td>4-20mA</td>
<td>3.200 to 20.800</td>
</tr>
</tbody>
</table>

**Channels Whose Input Type is PulseInput and Delta**

**Syntax**
```
SRangePulse, p1, p2, p3, p4, p5, p6, p7, p8, p9, p10, p11, p12, p13, p14
```

- **p1**: Channel number
- **p2**: Input type (PulseInput)
- **p3**: Range (LevelRange, ContactRange)
  - **LevelRange**: Level
  - **ContactRange**: Contact
- **p4**: Chattering filter (On, Off)
- **p5**: Math type (Delta)
- **p6**: Span lower limit
- **p7**: Span upper limit
- **p8**: Reference channel number

**Query**
```
SRangePulse[, p1]?
```

**Example**
```
Measure the pulse (level) on channel 0002.
Chattering filter is on. Math is on.
SRangePulse, 0002, PulseInput, LevelRange, On, Off, 0, 10000, 0, 200, "m3/min"
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

**Channels Whose Input Type is PulseInput and Linear Scaling**

**Syntax**
```
SRangePulse, p1, p2, p3, p4, p5, p6, p7, p8, p9, p10, p11
```

- **p1**: Channel number
- **p2**: Input type (PulseInput)
- **p3**: Range (LevelRange, ContactRange)
  - **LevelRange**: Level
  - **ContactRange**: Contact
- **p4**: Chattering filter (On, Off)
- **p5**: Math type (Scale)
- **p6**: Span lower limit
- **p7**: Span upper limit
- **p8**: Decimal place (0, 1, 2, 3, 4, 5)
- **p9**: Scaling lower limit
- **p10**: Scaling upper limit
- **p11**: Unit

**Query**
```
SRangePulse[, p1]?
```

**Example**
```
Measure the pulse (level) on channel 0002. Chattering filter is on. Math is on.
SRangePulse, 0002, PulseInput, LevelRange, On, Off, 0, 10000, 0, 200, "m3/min"
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

---

**SRRangePulse**

**Measurement Range of Pulse Input Channel**

Sets the measurement range of a pulse input channel.

**Unused Channels**

- **Syntax**
  ```
  SRangePulse, p1, p2
  ```
  - **p1**: Channel number
  - **p2**: Input type (Skip)

**Channels Whose Input Type is PulseInput and No Math**

- **Syntax**
  ```
  SRangePulse, p1, p2, p3, p4, p5, p6, p7
  ```
  - **p1**: Channel number
  - **p2**: Input type (PulseInput)
  - **p3**: Range (LevelRange, ContactRange)
    - **LevelRange**: Level
    - **ContactRange**: Contact
  - **p4**: Chattering filter (On, Off)
  - **p5**: Math type (Off)
  - **p6**: Span lower limit
  - **p7**: Span upper limit
### SRangeDI

**Measurement Range of DI Channel**
Sets the measurement range of a DI channel.

**Unused Channels**

**Syntax**

```
SRangeDI,p1,p2
```

- `p1`: Channel number
- `p2`: Input type (Skip)

**Channels That Are Not Delta, Scaling, Pulse Input**

**Syntax**

```
SRangeDI,p1,p2,p3,p4,p5,p6
```

- `p1`: Channel number
- `p2`: Input type (DI)
- `p3`: Fixed at "."
- `p4`: Calculation type (Off)
- `p5`: Span lower limit (0 to 1)
- `p6`: Span upper limit (0 to 1)

**Delta Channels**

**Syntax**

```
SRangeDI,p1,p2,p3,p4,p5,p6,p7
```

- `p1`: Channel number
- `p2`: Input type (DI)
- `p3`: Fixed at "."
- `p4`: Calculation type (Delta)
- `p5`: Span lower limit (0 to 1)
- `p6`: Span upper limit (0 to 1)
- `p7`: Reference channel number

**Scaling Channels**

**Syntax**

```
SRangeDI,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10
```

- `p1`: Channel number
- `p2`: Input type (DI)
- `p3`: Fixed at "."
- `p4`: Calculation type (Scale)
- `p5`: Span lower limit (0 to 1)
- `p6`: Span upper limit (0 to 1)
- `p7`: Decimal Place (0 to 5)
- `p8`: Scaling lower limit
- `p9`: Scaling upper limit
- `p10`: Unit (up to 6 characters, UTF-8)

**Pulse Input Channels**

**Syntax**

```
SRangeDI,p1,p2,p3,p4,p5,p6
```

- `p1`: Channel number
- `p2`: Input type (Pulse)
- `p3`: Fixed at "."
- `p4`: Math type (Off)
- `p5`: Span lower limit (0 to 999999)
- `p6`: Span upper limit (0 to 999999)

**Query**

```
SRangeDI,[p1]?
```

**Example**

Measure 0 to 1 on channel 0103. No scaling.
```
SRangeDI,0103,DI,~,Off,0,1
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- `p2=Pulse` can be specified when the math function (/ MT) is installed.
- If `p2=Pulse`, `p4=Delta` or `p5=Scale` cannot be specified.
- `p2=Pulse` cannot be specified when the operation mode of the DI module is set to Remote.
- You cannot use this command to configure settings when the measurement mode is set to high speed.

### SRangeDO

**DO Channel Operation**
Sets the DO channel operation.

**Alarm Output**

**Syntax**

```
SRangeDO,p1,p2,p3,p4,p5,p6,p7,p8,p9
```

- `p1`: Channel number
- `p2`: Output type (Alarm)
- `p3`: Span lower limit (0 to 1)
- `p4`: Span upper limit (0 to 1)
- `p5`: Unit (up to 6 characters, UTF-8)
- `p6`: Energize or de-energize
  - Energize: Energize the relay (DO channel) during output.
  - De_Energize: De-energize the relay (DO channel) during output.
- `p7`: Operation
  - And: Operate when all set alarms are in the alarm state.
  - Or: Operate when any of the set alarms are in the alarm state.
- `p8`: Hold or nonhold
  - Hold: Hold output until an alarm ACK operation.
  - Nonhold: Clear output when the alarm is cleared.
- `p9`: Relay (DO channel) action on acknowledge (Normal, Reset)
  - Energize: Energize the relay (DO channel) during output.
  - De_Energize: De-energize the relay (DO channel) during output.

**Alarm Output (Reflash)**

**Syntax**

```
SRangeDO,p1,p2,p3,p4,p5,p6,p7,p8,p9
```

- `p1`: Channel number
- `p2`: Output type (Alarm)
- `p3`: Span lower limit (0 to 1)
- `p4`: Span upper limit (0 to 1)
- `p5`: Unit (up to 6 characters, UTF-8)
- `p6`: Energize or de-energize
  - Energize: Energize the relay (DO channel) during output.
  - De_Energize: De-energize the relay (DO channel) during output.
- `p7`: Action (Reflash)
- `p8`: Reflash time (500ms, 1s, 2s)
- `p9`: Relay (DO channel) action on acknowledge
  - Energize: Energize the relay (DO channel) during output.
  - De_Energize: De-energize the relay (DO channel) during output.

**Manual Output**

Specifies the output value.
2.4 Setting Commands

**Syntax**
```
SRangeDO,p1,p2,p3,p4,p5,p6
```

- **p1**: Channel number
- **p2**: Output type (Manual)
- **p3**: Span lower limit (0 to 1)
- **p4**: Span upper limit (0 to 1)
- **p5**: Unit (up to 6 characters, UTF-8)
- **p6**: Energize or de-energize

**Fail Output (GM10 only)**

**Syntax**
```
SRangeDO,p1,p2,p3,p4,p5,p6
```

- **p1**: Channel number
- **p2**: Output type (Fail)
- **p3**: Span lower limit (0 to 1)
- **p4**: Span upper limit (0 to 1)
- **p5**: Unit (up to 6 characters, UTF-8)
- **p6**: Fixed to De_energize

**Query**
```
SRangeDO[,p1]?
```

**Example**
```
Output an alarm on channel 0203. Set the span lower limit to 0 and span upper limit to 1.
Specify energize operation, logic or operation, and hold operation. Set the action on ACK to Normal. Set the unit to "Unit."
```
```
SRangeDO,0203,Alarm,0,1,Unit,Energize,Or,Hold,Normal
```

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=Manual, you cannot set p7 or subsequent parameters.
- If p7=And or Or, you cannot set the reflash time.
- If individual alarm ACK is enabled (SIndivAlmACK command), p9 is fixed to Reset.

**SMoveAve**

**Moving Average**
Sets the moving average of an AI or PI channel.

**Syntax**
```
SMoveAve,p1,p2,p3
```

- **p1**: Channel number
- **p2**: Enable or disable (Off, On)
- **p3**: Number of samples

**Query**
```
SMoveAve[,p1]?
```

**Example**
```
Set the number of moving average samples for channel 0002 to 12.
```
```
SMoveAve,0002,On,12
```
**SFilter**

Sets the First-Order Lag Filter

Sets the first-order lag filter of a high-speed AI channel when a high-speed AI module is installed.

**Syntax**  
\[ \text{SFilter}, p_1, p_2, p_3 \]
  
  - `p1`: Channel number
  - `p2`: Enable or disable (Off, On)
  - `p3`: First-order lag coefficient (3 to 300)

**Query**  
\[ \text{SFilter}[\{p_1\}] \]

**Example**  
Set the first-order lag of channel 0002 to 100.

\[ \text{SFilter}, 0002, \text{On}, 100 \]

**Description**
- This command is valid only for channels on high-speed AI type analog input modules.

---

**SBurnOut**

Behavior When a Sensor Burns Out

Sets the behavior for when a burnout occurs on an AI channel.

**Syntax**  
\[ \text{SBurnOut}, p_1, p_2 \]
  
  - `p1`: Channel number
  - `p2`: Burnout processing (Off, Up, Down)

**Query**  
\[ \text{SBurnOut}[\{p_1\}] \]

**Example**  
Set the measured result to positive overflow (Up) when a burnout is detected on channel 0001.

\[ \text{SBurnOut}, 0001, \text{Up} \]

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- This command is invalid for 4-wire RTD modules.

---

**SRjc**

Reference Junction Compensation Method

Sets the reference junction compensation method of an AI channel.

**Syntax**  
\[ \text{SRjc}, p_1, p_2, p_3 \]
  
  - `p1`: Channel number
  - `p2`: Mode
    - Internal: Use the internal compensation function.
    - External: Use an external compensation device.
  - `p3`: Compensation temperature
    - 2.00 to 800
    - -20 to 800°C
    - -40 to 1760°F
    - 253.1 to 353.2K

**Query**  
\[ \text{SRjc}[\{p_1\}] \]

**Example**  
Perform reference junction compensation of channel 0003 using the internal compensation circuit.

\[ \text{SRjc}, 0003, \text{Internal} \]

Perform reference junction compensation of channel 0004 using an external compensation device. Set the compensation temperature to -2.3°C.

\[ \text{SRjc}, 0004, \text{External}, -23 \]

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If `p2=Internal`, `p3` is invalid.
- This command is invalid for 4-wire RTD modules.
**SAAlarmIO**

**Alarm**
Sets the alarm for an AI, DI, or PI channel.

**Do Not Set Alarms**

**Syntax**

```
SAlarmIO, p1, p2, p3
```

- **p1** Channel number
- **p2** Alarm number (1 to 4)
- **p3** Alarm on or off (Off)

**Do Not Output Alarms**

**Syntax**

```
SAlarmIO, p1, p2, p3, p4, p5, p6, p7
```

- **p1** Channel number
- **p2** Alarm number (1 to 4)
- **p3** Alarm on or off (On)
- **p4** Alarm type (H, L, DH, DL, RH, RL, TH, TL)
  - For a channel set to Log scale (/LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3), p4 is H, L, TH, or TL.
- **p5** Value
  - For a channel set to Log scale (/LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3), specify p5 using exponential notation (e.g. 1.23E10, where the number of digits of the mantissa is as specified by p8 of the SRangeAI command).
- **p6** Detection (Off, On)
- **p7** Output (Off)

**Output Alarms**

**Syntax**

```
SAlarmIO, p1, p2, p3, p4, p5, p6, p7, p8
```

- **p1** Channel number
- **p2** Alarm number (1 to 4)
- **p3** Alarm on or off (On)
- **p4** Alarm type (H, L, DH, DL, RH, RL, TH, TL)
  - For a channel set to Log scale (/LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3), p4 is H, L, TH, or TL.
- **p5** Value
  - For a channel set to Log scale (/LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3), specify p5 using exponential notation (e.g. 1.23E10, where the number of digits of the mantissa is as specified by p8 of the SRangeAI command).
- **p6** Detection (Off, On)
- **p7** Output (Off)
- **p8** Number
  - If p7=DO Output to a relay (DO channel)
  - If p7=SW Output to an internal switch

**Query Example**

Set a high limit alarm (H) on alarm number 2 of channel 0001. Set the alarm value to 1.8000V. Use the alarm detection function. When an alarm occurs, output to the relay (DO channel) at number 0205.

```
SAlarmIO, 0001, 2, On, H, 18000, On, DO, 0205
```

**Description**

- You cannot set this on a “Skip” channel.
- If p3=Off, you cannot set p4 or subsequent parameters.
- If p7=Off, you cannot set p8.
- For the alarm values of p5, use the values in the following table.

<table>
<thead>
<tr>
<th>Channel Type</th>
<th>Input Type</th>
<th>Calculation Type</th>
<th>Alarm Type</th>
<th>H, L, TH, TL</th>
<th>RH, RL, DH, DL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AI channel</td>
<td>Volt, GS, TC, RTD</td>
<td>Off</td>
<td>(1) (3)</td>
<td>(4)</td>
<td></td>
</tr>
<tr>

<tr>
<td></td>
<td>Scale</td>
<td>(1) (3) (5)</td>
<td>(6)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>PI channel</td>
<td>Pulse</td>
<td>Off, 0, 1</td>
<td>0 - 999999 1 - 999999 Off</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Scale</td>
<td>(1) (3) (5)</td>
<td>(6)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(1) Within the measurement range
(2) –5% to 105% of the scale but within –999999 to 999999 excluding the decimal point
(3) 1 digit to (measurement upper limit – measurement lower limit)
(4) 1 digit to (scale upper limit – scale lower limit) but within 1 to 999999 excluding the decimal point
(5) Within the difference measurement range
(6) Log scale range that corresponds to -5% to 105% of the span

- You cannot set DO channels or internal switches whose output type is set to Manual as output destination numbers.
- You cannot set DI channels when the measurement mode is set to high speed.

**SAlmHysIO**

**Alarm Hysteresis**
Sets the alarm hysteresis for an AI, DI, or PI channel.

**Syntax**

```
SAlmHysIO, p1, p2, p3
```

- **p1** Channel number
- **p2** Alarm number (1 to 4)
- **p3** Hysteresis

**Alarm Type**

- H, L, DH, DL
  - 0.0% to 5.0% of the span or scale width
  - However, this is fixed to 0 for DI channels.
- Delta
  - 0 to 5.0% of the measurement range
- Linear scaling, Square root
  - 0 to 100000
- Log scale (/LG)
  - Fixed to 0.

**Example**

Set a high limit alarm (H) on alarm number 2 of channel 0001. Set the alarm value to 1.8000V. Use the alarm detection function. When an alarm occurs, output to the relay (DO channel) at number 0205.
### SAlmHysIO

**Query**
SAlmHysIO[,p1[,p2]]?

**Example**
Set a 0.5% hysteresis on alarm 3 of channel 0002.
SAlmHysIO,0002,3,5

**Description**
- Hysteresis specified for delay high and low limit alarms (TH and TL) and high and low limits on rate-of-change alarms (RH and RL) do not apply.
- When the input type of a DI channel is Pulse, hysteresis is fixed at 0.
- You cannot set DI channels when the measurement mode is set to high speed.

### SAlmDlyIO

**Alarm Delay Time**
Sets the delay alarm time for an AI, DI, or PI channel.

**Syntax**
SAlmDlyIO,p1,p2,p3,p4

- p1 Channel number
- p2 Hour (0 to 24)
- p3 Minute (0 to 59)
- p4 Second (0 to 59)

**Query**
SAlmDlyIO[,p1]?

**Example**
Set the channel 0001 alarm delay time to 2 minutes 30 seconds.
SAlmDlyIO,0001,0,2,30

**Description**
- Set the delay time so that it is an integer multiple of the scan interval (SScan command).
- You cannot set DI channels when the measurement mode is set to high speed.

### STagIO

**Tag**
Sets a tag to an AI, DI, PI, AO, DO, or PID channel.

**Syntax**
STagIO,p1,p2,p3

- p1 Channel number
- p2 Tag (up to 32 characters, UTF-8)
- p3 Tag number (up to 16 characters, ASCII)

**Query**
STagIO[,p1]?

**Example**
Set the channel 0001 tag to “SYSTEM1” and the tag number to “TI002.”
STagIO,0001,’SYSTEM1’,’TI002’

**Description**
- You cannot set DI channels when the measurement mode is set to high speed.

### SColorIO

**Channel Color**
Sets the color of an AI, DI, PI, AO, DO, or PID channel.

**Syntax**
SColorIO,p1,p2,p3,p4

- p1 Channel number
- p2 R value of RGB display colors (0 to 255, see “Description.”)
- p3 G value of RGB display colors (0 to 255, see “Description.”)
- p4 B value of RGB display colors (0 to 255, see “Description.”)

**Query**
SColorIO[,p1]?

**Example**
Set the channel 0001 display color to red.
SColorIO,0001,255,0,0

**Description**
- The RGB values for different colors are indicated in the following table.

<table>
<thead>
<tr>
<th>Color</th>
<th>R</th>
<th>G</th>
<th>B</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>255</td>

</table>

- You cannot set DI channels when the measurement mode is set to high speed.
### SZoneIO

**Waveform Display Zone**
Sets the waveform display zone of an AI, DI, PI, AO, DO, or PID channel.

**Syntax**
```
SZoneIO, p1, p2, p3
```
- **p1**: Channel number
- **p2**: Zone lower limit [%] (0 to 95)
- **p3**: Zone upper limit [%] (5 to 100)

**Query**
```
SZoneIO[,p1]?
```

**Example**
Set the waveform zone of channel 0001 waveform to 0% to 30%.
```
SZoneIO, 0001, 0, 30
```

**Description**
- You cannot set DI channels when the measurement mode is set to high speed.

### SPartialIO

**Partial Expanded Display [GX/GP]**
Sets the partial-expansion display of an AI, PI, or PID channel waveform.

**Syntax**
```
SPartialIO, p1, p2, p3, p4
```
- **p1**: Channel number
- **p2**: Partial expanded On/Off (On, Off)
- **p3**: Partial expanded boundary position [%] (1 to 99)
- **p4**: Partial expanded boundary value (span lower limit + 1 digit to span upper limit - 1 digit)

**Query**
```
SPartialIO[,p1]?
```

**Example**
For channel 0001 whose measurement range is 0 to 1.0000 V, display the measured value of 0.7500 V at the 50% position.
```
SPartialIO, 0001, On, 50, 7500
```

**Description**
- You cannot set this on a “Skip” channel. p2 is fixed to Off.
- You cannot set this on a channel set to Log scale (/LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3). p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- P2=On can be specified when the difference between the span upper and lower limits is 2 digits or greater.

### SScaleIO

**Scale Display [GX/GP]**
Sets the scale display of an AI, DI, PI, AO, DO, or PID channel.

**Syntax**
```
SScaleIO, p1, p2, p3
```
- **p1**: Channel number
- **p2**: Scale display position (Off, 1 to 10)
- **p3**: Number of scale divisions (4 to 12, C10)

**Query**
```
SScaleIO[,p1]?
```

**Example**
Display the channel 0001 scale at display position 1. Display four equally spaced main scale marks.
```
SScaleIO, 0001, 1, 4
```

**Description**
- You cannot set DI channels when the measurement mode is set to high speed.

### SBarIO

**Bar Graph Display**
Sets the bar graph display of an AI, DI, PI, AO, DO, or PID channel.

**Syntax**
```
SBarIO, p1, p2, p3
```
- **p1**: Channel number
- **p2**: Bar display base position (Lower, Center, Upper)
- **p3**: Number of scale divisions (4 to 12)

**Query**
```
SBarIO[,p1]?
```

**Example**
Display the measured values of channel 0001 on a bar graph with the center set as the base position (Center). Display four equally spaced main scale marks.
```
SBarIO, 0001, Center, 4
```

**Description**
- You cannot set DI channels when the measurement mode is set to high speed.

### SBandIO

**Color Scale Band**
Sets the color scale band of an AI or PI channel.

**Syntax**
```
SBandIO, p1, p2, p3, p4, p5, p6, p7
```
- **p1**: Channel number
- **p2**: Color scale band (Off, In, Out)
- **p3**: R value of the color scale band RGB colors (0 to 255)
- **p4**: G value of the color scale band RGB colors (0 to 255)
- **p5**: B value of the color scale band RGB colors (0 to 255)
- **p6**: Upper limit of the color scale band display (Span or scale lower limit to span or scale upper limit)
- **p7**: Lower limit of the color scale band display (Span or scale lower limit to span or scale upper limit)

For a channel set to Log scale (/LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3), specify p6 using exponential notation (e.g. 1.23E10, where the number of digits of the mantissa is as specified by p8 of the SRangeAI command).

**Example**
For a channel set to Log scale (LG) (if p4 of SRangeAI is LogT1, LogT2, or LogT3), specify p6 using exponential notation (e.g. 1.23E10, where the number of digits of the mantissa is as specified by p8 of the SRangeAI command).
### Commands and Responses

#### SBandIO

**Query**  
SBandIO[,p1]?

**Example**  
For channel 0001, set a blue band in the range of -0.5000 to 1.0000.

\[ \text{SBandIO},0001,\text{in},0,0,255,5000,10000 \]

**Description**

- You cannot set this on a “Skip” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- For details on RGB values, see “Description” of the SColorIO command.

#### SColorIO

**Description**

- You cannot set this on a “Skip” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- For details on RGB values, see “Description” of the SColorIO command.

### SAlmMarkIO

**Alarm Mark**

Sets the display of the marker that indicates the specified alarm position of an AI, DI, or PI channel.

**Syntax**  
SAlmMarkIO,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13,p14,p15

- **p1** Channel number
- **p2** Whether to display the alarm mark on the scale (Off, On)
- **p3** Alarm mark type  
  - Alarm: Display the default alarm mark
  - Fixed: Display the mark with the specified color
- **p4** R value of the RGB mark colors for alarm 1 (0 to 255)
- **p5** G value of the RGB mark colors for alarm 1 (0 to 255)
- **p6** B value of the RGB mark colors for alarm 1 (0 to 255)
- **p7** R value of the RGB mark colors for alarm 2 (0 to 255)
- **p8** G value of the RGB mark colors for alarm 2 (0 to 255)
- **p9** B value of the RGB mark colors for alarm 2 (0 to 255)
- **p10** R value of the RGB mark colors for alarm 3 (0 to 255)
- **p11** G value of the RGB mark colors for alarm 3 (0 to 255)
- **p12** B value of the RGB mark colors for alarm 3 (0 to 255)
- **p13** R value of the RGB mark colors for alarm 4 (0 to 255)
- **p14** G value of the RGB mark colors for alarm 4 (0 to 255)
- **p15** B value of the RGB mark colors for alarm 4 (0 to 255)

**Query**  
SAlmMarkIO[,p1]?

**Example**  
Display the alarm marks for alarms 1 to 4 of channel 0001 in fixed colors red, brown, orange, and yellow, respectively.

\[ \text{SAlmMarkIO},0001,\text{On},\text{Fixed},255,0,0,165,42,42,255,165,0,255,255,0 \]

**Description**

- For details on RGB values, see “Description” of the SColorIO command.
- You cannot set DI channels when the measurement mode is set to high speed.

#### SValueIO

**Upper/Lower Limit Display Characters**

Sets the upper/lower limit display characters of AI, DI, DO, or PID channel.

**Syntax**  
SValueIO,p1,p2,p3

- **p1** Channel number
- **p2** Lower limit display string (up to 8 characters, UTF-8)
- **p3** Upper limit display string (up to 8 characters, UTF-8)

**Query**  
SValueIO[,p1]?

**Example**  
For channel 0001, set the lower limit to “OFF” and the upper limit to “ON.”

\[ \text{SValueIO},0001,’OFF’,’ON’ \]
### SCalibIO

#### Calibration Correction
Sets the calibration correction for AI channels.

**Disable Calibration Correction**

**Syntax**

SCalibIO,p1,p2

- **p1**: Channel number
- **p2**: Linearizer mode (Off)

**Use Calibration Correction (Linearizer approximation, linearizer bias)**

**Syntax**

SCalibIO,p1

- **p1**: Channel number
- **p2**: Linearizer mode

**Appro** Linealizer approximation

**Bias** Linearizer bias

- **p3**: Number of set points (2 to 12)
- **p4**: Input value of set point 1
- **p5**: Output value of set point 1
- **p6**: Input value of set point 2
- **p7**: Output value of set point 2
- **p8**: Input value of set point 3
- **p9**: Output value of set point 3
- **p10**: Input value of set point 4
- **p11**: Output value of set point 4
- **p12**: Input value of set point 5
- **p13**: Output value of set point 5
- **p14**: Input value of set point 6
- **p15**: Output value of set point 6
- **p16**: Input value of set point 7
- **p17**: Output value of set point 7
- **p18**: Input value of set point 8
- **p19**: Output value of set point 8
- **p20**: Input value of set point 9
- **p21**: Output value of set point 9
- **p22**: Input value of set point 10
- **p23**: Output value of set point 10
- **p24**: Input value of set point 11
- **p25**: Output value of set point 11
- **p26**: Input value of set point 12
- **p27**: Output value of set point 12

**Use Calibration Correction (Correction coefficient) (\(1/\text{AH}\))**

**Syntax**

- **p1**: Channel number
- **p2**: Mode
- **Correct**: Correction coefficient
- **p3**: Number of correction points (2 to 12)
- **p4**: Input value of uncorrected value 1
- **p5**: Instrument correction coefficient 1
- **p6**: Sensor correction coefficient 1
- **p7**: Input value of uncorrected value 2
- **p8**: Instrument correction coefficient 2
- **p9**: Sensor correction coefficient 2
- **p10**: Input value of uncorrected value 3
- **p11**: Instrument correction coefficient 3
- **p12**: Sensor correction coefficient 3
- **p13**: Input value of uncorrected value 4
- **p14**: Instrument correction coefficient 4
- **p15**: Sensor correction coefficient 4
- **p16**: Input value of uncorrected value 5
- **p17**: Instrument correction coefficient 5
- **p18**: Sensor correction coefficient 5
- **p19**: Input value of uncorrected value 6
- **p20**: Instrument correction coefficient 6
- **p21**: Sensor correction coefficient 6
- **p22**: Input value of uncorrected value 7
- **p23**: Instrument correction coefficient 7
- **p24**: Sensor correction coefficient 7
- **p25**: Input value of uncorrected value 8
- **p26**: Instrument correction coefficient 8
- **p27**: Sensor correction coefficient 8
- **p28**: Input value of uncorrected value 9
- **p29**: Instrument correction coefficient 9
- **p30**: Sensor correction coefficient 9
- **p31**: Input value of uncorrected value 10
- **p32**: Instrument correction coefficient 10
- **p33**: Sensor correction coefficient 10
- **p34**: Input value of uncorrected value 11
- **p35**: Instrument correction coefficient 11
- **p36**: Sensor correction coefficient 11
- **p37**: Input value of uncorrected value 12
- **p38**: Instrument correction coefficient 12
- **p39**: Sensor correction coefficient 12

**Query**

SCalibIO[,p1]?

**Example**

Set three set points on channel 0001 (measurement range: 0 to 1.0000 V). Set the set points as follows: when the input value is 0 V, the output value is 0.0010 V; when the input value is 0.5000 V, the output value is 0.5020 V; when the input value is 1.0000 V, the output value is 0.9970 V.

SCalibIO,0001,Appro,3,0,10,5000,5020,10000,9970

**Description**

- If p2=Off, you cannot set p3 or subsequent parameters.
- You cannot specify set points beyond the number of points specified by p3.
- If the AI channel input type (p2 of SRangeAI) is set to Skip or DI, you cannot specify anything other than p2=Off.
**SPresetAO**

Sets the Preset Action

Sets the preset action of an AO channel.

**Syntax**

SPResetAO, p1, p2, p3, p4

- **p1** Channel number
- **p2** Action at power-on (Last, Preset)
  - Last: Hold previous value
  - Preset: Output preset value
- **p3** Action on error (Last, Preset)
  - Last: Hold previous value
  - Preset: Output preset value
- **p4** Action on stop (Last, Preset)
  - Last: Hold previous value
  - Preset: Output preset value

**Query**

SPresetAO[, p1]?

**Example**

At power-on, replace the channel 0001 value with the preset value of 0.5.

SPresetAO, 0001, Preset, 0.5

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- “Action on stop” indicates a scanning stopped, math stopped, or re-transmission off condition.

**SMathBasic**

Math Action (/MT)

Sets the basic operation of math channels.

**Syntax**

SMathBasic, p1, p2, p3, p4, p5

- **p1** Indication on computation error
  - +Over: Display the computed value as +Over.
  - −Over: Display the computed value as −Over.
- **p2** SUM and AVE computation when overflow data is detected
  - Error: Sets the computation result to computation error.
  - Skip: Discards the data that overflowed and continues the computation.
  - Limit: Computes by substituting upper or lower limit values in the data that overflowed.
    - For channels that do not have linear scaling specified, the upper or lower limit of the measuring range.
    - For channels that have linear scaling specified, the scaling upper or lower limit.

**Query**

SMathBasic?

**Example**

Set the indication on computation error to “+Over,” computation when overflow data is detected to “Skip,” and start computation when recording starts.

SMathBasic, +Over, Skip, Skip, Start/Stop

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- p5 and p6 are invalid parameters for the GX/GP.
- When the multi batch function (/BT) is enabled, p4 is fixed to Off.
### SKConst

**Constant (/MT)**

Sets a constant for use in computations.

**Syntax**

```
SKConst,p1,p2
```

- `p1` Constant number (1 to 100)
- `p2` Value (–9.9999999E+29 to –1E–30, 0, 1E–30 to 9.9999999E+29, eight significant digits)

**Query**

```
SKConst[,]p1]
```

**Example**

Set constant number 12 to 1.0000E–10.

```
SKConst,12,1.0000E-10
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

### STlogMath

**TLOG (/MT)**

Sets the TLOG of a math channel.

**Syntax**

```
STlogMath,p1,p2,p3,p4,p5
```

- `p1` Channel number
- `p2` Timer Type
- `p3` Timer number (1 to 12)
- `p4` Sum scale (Off, /sec, /min, /hour)
- `p5` Reset (On, Off)

**Query**

```
STlogMath[,]p1]
```

**Example**

Assign timer 2 to math channel 015. Set the sum scale to Off and disable reset.

```
STlogMath,015,Timer,2,Off,Off
```

**Description**

- You cannot use this command to configure settings while computation is in progress.

### SRolAveMath

**Rolling Average (/MT)**

Sets rolling average on a math channel.

**Syntax**

```
SRolAveMath,p1,p2,p3,p4
```

- `p1` Channel number
- `p2` Enable or disable (Off, On)
- `p3` Sample interval (1 to 6s, 10s, 12s, 15s, 20s, 30s, 1 to 6min, 10min, 12min, 15min, 20min, 30min, 1h)
- `p4` Number of samples (1 to 1500)

**Query**

```
SRolAveMath[,]p1]
```

**Example**

On math channel 015, take the rolling average of 30 data values over 1 minute intervals and use the results as the computed values.

```
SRolAveMath,015,On,1min,30
```
## SAlarmMath

### Alarm (/M/T)
Sets the alarm of a math channel.

**Do Not Set Alarms**

**Syntax**

```
SAlarmMath, p1, p2, p3
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Alarm on or off (Off)

**Do Not Output Alarms**

**Syntax**

```
SAlarmMath, p1, p2, p3, p4, p5, p6, p7
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Alarm on or off (On)
- `p4`: Alarm type (H, L, TH, TL)
- `p5`: Alarm value (within the span range)
- `p6`: Detection (Off, On)
- `p7`: Output (Off)

**Output Alarms**

**Syntax**

```
SAlarmMath, p1, p2, p3, p4, p5, p6, p7, p8
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Alarm on or off (On)
- `p4`: Alarm type (H, L, TH, TL)
- `p5`: Alarm value (within the span range)
- `p6`: Detection (Off, On)
- `p7`: Output
  - DO: Output to a relay (DO channel)
  - SW: Output to an internal switch
- `p8`: Number
  - If `p7`=DO: Relay (DO channel) number
  - If `p7`=SW: Internal switch number (001 to 100)

**Channel Using Logarithmic Math**

**Syntax**

```
SAlarmMath, p1, p2, p3, p4, p5, p6, p7, p8, p9
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Alarm on or off (Off)
- `p4`: Alarm type (Off, H, L, TH, TL)
- `p5`: Alarm value exponent (100 to 999)
- `p6`: Alarm value mantissa (-16 to 16)
- `p7`: Detection (Off, On)
- `p8`: Output
  - Off: Do Not Output Alarms
  - DO: Output to a relay (DO channel)
  - SW: Output to an internal switch
- `p9`: Number
  - If `p8`=DO: Relay (DO channel) number
  - If `p8`=SW: Internal switch number (001 to 100)

### Query

`SAlarmMath[, p1[, p2]]?`

### Example

Set a high limit alarm (H) on alarm number 2 of math channel 015. Set the alarm value to 85.0. When an alarm occurs, output to the relay (DO channel) at number 0105.

```
SAlarmMath, 015, 2, On, H, 850, On, DO, 0105
```

**Description**

- You cannot set this on a “Off” channel.
- If `p3`=Off, you cannot set `p4` or subsequent parameters.
- If `p7` (p8 for logarithmic math) = Off, you cannot set `p8` (p9 for logarithmic math).
- You cannot set DO channels or internal switches whose output type is set to Manual as output destination numbers.

## SAlmHysMath

### Alarm Hysteresis (/M/T)
Sets the alarm hysteresis for a math channel.

**Syntax**

```
SAlmHysMath, p1, p2, p3
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Hysteresis

**Channel Using Logarithmic Math**

**Syntax**

```
SAlmHysMath, p1, p2, p3, p4
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Hysteresis exponent (100 to 999)
- `p4`: Hysteresis mantissa (-16 to 16)

### Query

`SAlmHysMath[, p1[, p2]]?`

### Example

Set a hysteresis on alarm 3 of math channel 015.

```
SAlmHysMath, 015, 3, 10
```

**Description**

- Hysteresis specified for delay high and low limit alarms (TH and TL) does not apply.

## SAlmDlyMath

### Alarm Delay Time (/M/T)
Sets the alarm delay time for a math channel.

**Syntax**

```
SAlmDlyMath, p1, p2, p3, p4
```

- `p1`: Channel number
- `p2`: Alarm number (1 to 4)
- `p3`: Alarm on or off (Off, On)
- `p4`: Alarm type (Off, H, L, TH, TL)
- `p5`: Alarm value exponent (100 to 999)
- `p6`: Alarm value mantissa (-16 to 16)
- `p7`: Detection (Off, On)
- `p8`: Output
  - Off, DO, SW

### Query

`SAlmDlyMath[, p1]?`

### Example

Set the math channel 015 alarm delay time to 2 minutes 30 seconds.

```
SAlmDlyMath, 015, 0, 2, 30
```

**Description**

- Set the delay time so that it is an integer multiple of the scan interval (`SScan` command).
### 2.4 Setting Commands

#### STagMath

**Tag (/MT)**

Sets the tag of a math channel.

**Syntax**

```
STagMath, p1, p2, p3
```

- **p1** Channel number
- **p2** Tag (up to 32 characters, UTF-8)
- **p3** Tag number (up to 16 characters, UTF-8)

**Query**

```
STagMath[,p1]?
```

**Example**

Set the math channel 015 tag to “SYSTEM1” and the tag number to “TI002.”

```
STagMath, 015, 'SYSTEM1', 'TI002'
```

#### SColorMath

**Channel Color (/MT)**

Sets the color of a math channel.

**Syntax**

```
SColorMath, p1, p2, p3, p4
```

- **p1** Channel number
- **p2** R value of RGB display colors (0 to 255)
- **p3** G value of RGB display colors (0 to 255)
- **p4** B value of RGB display colors (0 to 255)

**Query**

```
SColorMath[,p1]?
```

**Example**

Set the math channel 015 display color to red.

```
SColorMath, 015, 255, 0, 0
```

**Description**

- For details on RGB values, see “Description” of the **SColorIO** command.

#### SZoneMath

**Waveform Display Zone (/MT)**

Sets the waveform display zone of a math channel.

**Syntax**

```
SZoneMath, p1, p2, p3
```

- **p1** Channel number
- **p2** Zone lower limit [%] (0 to 95)
- **p3** Zone upper limit [%] (5 to 100)

**Query**

```
SZoneMath[,p1]?
```

**Example**

Set the waveform zone of math channel 015 waveform to 0% to 30%.

```
SZoneMath, 015, 0, 30
```

#### SScaleMath

**Scale Display (/MT) [GX/GP]**

Sets the scale display of a math channel.

**Syntax**

```
SScaleMath, p1, p2, p3
```

- **p1** Channel number
- **p2** Scale display position (Off, 1 to 10)
- **p3** Number of scale divisions (4 to 12, C10)

**Query**

```
SScaleMath[,p1]?
```

**Example**

Display the math channel 015 scale at display position 1. Display four equally spaced main scale marks.

```
SScaleMath, 015, 1, 4
```

#### SBarMath

**Bar Graph Display (/MT)**

Sets the bar graph display of a math channel.

**Syntax**

```
SBarMath, p1, p2, p3
```

- **p1** Channel number
- **p2** Bar display base position
  - Lower
  - Center
  - Upper
- **p3** Number of scale divisions (4 to 12)

**Query**

```
SBarMath[,p1]?
```

**Example**

Display the computed values of math channel 015 on a bar graph with the center set as the base position (Center). Display four equally spaced main scale marks.

```
SBarMath, 015, Center, 0, 4
```

#### SPartialMath

**Partial Expanded Display (/MT) [GX/GP]**

Sets the partial expanded display of a math channel waveform.

**Syntax**

```
SPartialMath, p1, p2, p3, p4
```

- **p1** Channel number
- **p2** Partial expanded On/Off (On, Off)
- **p3** Partial expanded boundary position [%] (1 to 99)
- **p4** Partial expanded boundary value

**Query**

```
SPartialMath[,p1]?
```

**Example**

For channel 015 whose measurement range is 0 to 1.0000 V, display the measured value of 0.7500 V at the 50% position.

```
SPartialMath, 015, On, 50, 7500
```

**Description**

- You cannot set this on a “Off” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- P2=On can be specified when the difference between the span upper and lower limits is 2 digits or greater.
- You cannot use this command to configure settings on channels using logarithmic math.
### SBandMath

**Color Scale Band (/MT)**
Sets the color scale band of a math channel.

**Syntax**
```
SBandMath,p1,p2,p3,p4,p5,p6,p7
```
- **p1**: Channel number
- **p2**: Color scale band (Off, In, Out)
- **p3**: R value of the color scale band RGB colors (0 to 255)
- **p4**: G value of the color scale band RGB colors (0 to 255)
- **p5**: B value of the color scale band RGB colors (0 to 255)
- **p6**: Upper limit of the color scale band display (span lower limit to span upper limit)
- **p7**: Lower limit of the color scale band display (span lower limit to span upper limit)

**Channel Using Logarithmic Math**

**Syntax**
```
SBandMath,p1,p2,p3,p4,p5,p6,p7,p8,p9
```
- **p1**: Channel number
- **p2**: Color scale band (Off, In, Out)
- **p3**: R value of the color scale band RGB colors (0 to 255)
- **p4**: G value of the color scale band RGB colors (0 to 255)
- **p5**: B value of the color scale band RGB colors (0 to 255)
- **p6**: Exponent of the lower limit of the color scale band display (span low limit to span high limit)
- **p7**: Mantissa of the lower limit of the color scale band display (span low limit to span high limit)
- **p8**: Exponent of the upper limit of the color scale band display (span low limit to span high limit)
- **p9**: Mantissa of the upper limit of the color scale band display (span low limit to span high limit)

**Query**
```
SBandMath[,p1]?
```

**Example**
For math channel 015, set a blue band in the range of -0.5000 to 1.0000.
```
SBandMath,015,In,0,0,255,5000,10000
```

**Description**
- You cannot set this on an “Off” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- For details on RGB values, see “Description” of the SColorIO command.

### SAImMarkMath

**Alarm Mark (/MT)**
Sets the display of the marker that indicates the specified alarm position of a math channel.

**Syntax**
```
SAImMarkMath,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13,p14,p15
```
- **p1**: Channel number
- **p2**: Whether to display the alarm mark on the scale (Off, On)
- **p3**: Alarm mark type
  - Alarm: Display the default alarm mark
  - Fixed: Display the mark with the specified color
- **p4**: R value of the RGB mark colors for alarm 1 (0 to 255)
- **p5**: G value of the RGB mark colors for alarm 1 (0 to 255)
- **p6**: B value of the RGB mark colors for alarm 1 (0 to 255)
- **p7**: R value of the RGB mark colors for alarm 2 (0 to 255)
- **p8**: G value of the RGB mark colors for alarm 2 (0 to 255)
- **p9**: B value of the RGB mark colors for alarm 2 (0 to 255)
- **p10**: R value of the RGB mark colors for alarm 3 (0 to 255)
- **p11**: G value of the RGB mark colors for alarm 3 (0 to 255)
- **p12**: B value of the RGB mark colors for alarm 3 (0 to 255)
- **p13**: R value of the RGB mark colors for alarm 4 (0 to 255)
- **p14**: G value of the RGB mark colors for alarm 4 (0 to 255)
- **p15**: B value of the RGB mark colors for alarm 4 (0 to 255)

**Query**
```
SAImMarkMath[,p1]?
```

**Example**
Display the alarm marks for alarms 1 to 4 of math channel 015 in fixed colors red, brown, orange, and yellow, respectively.
```
SAImMarkMath,015,On,Fixed,255,165,255,0,165,42,255,165,0,255,255,0
```

**Description**
- For details on RGB values, see “Description” of the SColorIO command.
## **SRangeCom**

### Measurement Range (/MC)
Sets the measurement range of a communication channel.

**Unused Channels**

Syntax: `SRangeCom,p1,p2`
- **p1**: Channel number
- **p2**: Enable or disable (Off)

**Used Channels**

Syntax: `SRangeCom,p1,p2,p3,p4,p5,p6`
- **p1**: Channel number
- **p2**: Enable or disable (On)
- **p3**: Decimal Place (0 to 5)
- **p4**: Span lower limit (-9999999 to 99999999)
- **p5**: Span upper limit (-9999999 to 99999999)
- **p6**: Unit (up to 6 characters, UTF-8)

**Query Example**
- Measure 0.00 to 100.00% on communication channel 025.
  
  `SRangeCom,025,On,2,0,10000,"%"`

### Description
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=Off, you cannot set p3 or subsequent parameters.
- You cannot set the span upper and lower limits to the same value.

## **SVValueCom**

### Preset Operation (/MC)
Sets the preset operation of a communication channel.

**Syntax**

`SVValueCom,p1,p2,p3`
- **p1**: Channel number
- **p2**: Value at power-on (Preset, Last)
- **p3**: Preset value (–9.999999E+29 to –1E–30, 0, 1E–30 to 9.999999E+29)

**Query Example**
- At power-on, replace the communication channel 025 value with the preset value of 0.5.
  
  `SVValueCom,025,Preset,0.5`

## **SWDCom**

### Watchdog Timer (/MC)
Sets the watchdog timer of a communication channel.

**Channels That Do Not Use Watchdog Timers**

Syntax: `SWDCom,p1,p2`
- **p1**: Channel number
- **p2**: Watchdog timer usage (Off)

**Channels That Use Watchdog Timers**

Syntax: `SWDCom,p1,p2,p3,p4`
- **p1**: Channel number
- **p2**: Watchdog timer usage (On)
- **p3**: Watchdog timer (1 to 120) [s]
- **p4**: Value at timer expired (Preset, Last)

**Query Example**
- Set the watchdog timer of communication channel 025 to 60 seconds. Replace the communication channel 025 value with its preset value at watchdog timer expiration.
  
  `SWDCom,025,On,60,Preset`

**Description**
- If p2=Off, you cannot set p3 or subsequent parameters.

## **SAAlarmCom**

### Alarm (/MC)
Sets the alarm of a communication channel.

**No Alarm Setting**

Syntax: `SAAlarmCom,p1,p2,p3`
- **p1**: Channel number
- **p2**: Alarm number (1 to 4)
- **p3**: Alarm on or off (Off)

**Do Not Output Alarms**

Syntax: `SAAlarmCom,p1,p2,p3,p4,p5,p6,p7`
- **p1**: Channel number
- **p2**: Alarm number (1 to 4)
- **p3**: Alarm on or off (On)
- **p4**: Alarm type (H, L, TH, TL)
- **p5**: Alarm value (within the span range)
- **p6**: Detection (Off, On)
- **p7**: Output (Off)

**Output Alarms**

Syntax: `SAAlarmCom,p1,p2,p3,p4,p5,p6,p7,p8`
- **p1**: Channel number
- **p2**: Alarm number (1 to 4)
- **p3**: Alarm on or off (On)
- **p4**: Alarm type (H, L, TH, TL)
- **p5**: Alarm value (within the span range)
- **p6**: Detection (Off, On)
- **p7**: Output (Off)
- **DO**: Output to a relay (DO channel)
- **SW**: Output to an internal switch
### Commands and Responses

#### 2.4 Setting Commands

**STagCom**

**Tag (/MC)**
Sets the tag of a communication channel.

**Syntax**

```
STagCom,p1,p2,p3
```

- `p1`: Channel number
- `p2`: Tag (up to 32 characters, UTF-8)
- `p3`: Tag number (up to 16 characters, ASCII)

**Query**
```
STagCom[,p1]?
```

**Example**
Set the communication channel 025 tag to “SYSTEM1” and the tag number to “TI002.”

```
STagCom,025,’SYSTEM1’,’TI002’
```

#### SColorCom

**Channel Color (/MC)**
Sets the color of a communication channel.

**Syntax**

```
SColorCom,p1,p2,p3,p4
```

- `p1`: Channel number
- `p2`: R value of RGB display colors (0 to 255)
- `p3`: G value of RGB display colors (0 to 255)
- `p4`: B value of RGB display colors (0 to 255)

**Query**
```
SColorCom[,p1]?
```

**Example**
Set the communication channel 025 display color to red.

```
SColorCom,025,255,0,0
```

#### SZoneCom

**Waveform Display Zone (/MC)**
Sets the waveform display zone of a communication channel.

**Syntax**

```
SZoneCom,p1,p2,p3
```

- `p1`: Channel number
- `p2`: Zone lower limit [%] (0 to 95)
- `p3`: Zone upper limit [%] (5 to 100)

**Query**
```
SZoneCom[,p1]?
```

**Example**
Set the waveform zone of communication channel 025 waveform to 0% to 30%.

```
SZoneCom,025,0,30
```

#### SScaleCom

**Scale Display (/MC) [GX/GP]**
Sets the scale display of a communication channel.

**Syntax**

```
SScaleCom,p1,p2,p3
```

- `p1`: Channel number
- `p2`: Scale display position (Off, 1 to 10)
- `p3`: Number of scale divisions (4 to 12, C10)

**Query**
```
SScaleCom[,p1]?
```

**Example**
Display the communication channel 025 scale at display position 1. Display four equally spaced main scale marks.

```
SScaleCom,025,1,4
```
2.4 Setting Commands

**SBarCom**

Bar Graph Display (/MC)
Sets the bar graph display of a communication channel.

**Syntax**

SBarCom,p1,p2,p3

- **p1**: Channel number
- **p2**: Bar display base position
  - Lower
  - Center
  - Upper
- **p3**: Number of scale divisions (4 to 12)

**Query**

SBarCom[,p1]?

**Example**

Display the values of communication channel 025 on a bar graph with the center set as the base position (Center). Display four equally spaced main scale marks.

SBarCom,025,Center,4

**Description**

- You cannot set this on a “Off” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- For details on RGB values, see “Description” of the SColorIO command.

**SPartialCom**

Partial Expanded Display (/MC) [GX/GP]
Sets the partial expanded display of a communication channel waveform.

**Syntax**

SPartialCom,p1,p2,p3,p4

- **p1**: Channel number
- **p2**: Partial expanded On/Off (On, Off)
- **p3**: Partial expanded boundary position [%] (1 to 99)
- **p4**: Partial expanded boundary value

**Query**

SPartialCom[,p1]?

**Example**

For channel 025 whose measurement range is 0 to 1.0000 V, display the measured value of 0.7500 V at the 50% position.

SPartialCom,025,On,50,7500

**Description**

- You cannot set this on a “Off” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- P2=On can be specified when the difference between the span upper and lower limits is 2 digits or greater.

**SBandCom**

Color Scale Band (/MC)
Sets the color scale band of a communication channel.

**Syntax**

SBandCom,p1,p2,p3,p4,p5,p6,p7

- **p1**: Channel number
- **p2**: Color scale band (Off, In, Out)
- **p3**: R value of the color scale band RGB colors (0 to 255)
- **p4**: G value of the color scale band RGB colors (0 to 255)
- **p5**: B value of the color scale band RGB colors (0 to 255)
- **p6**: Upper limit of the color scale band display (span lower limit to span upper limit)
- **p7**: Lower limit of the color scale band display (span lower limit to span upper limit)

**Query**

SBandCom[,p1]?

**Example**

For communication channel 025, set a blue band in the range of -0.5000 to 1.0000.

SBandCom,025,In,0,0,255,5000,10000

**Description**

- You cannot set this on a “Off” channel. p2 is fixed to Off.
- If p2=Off, you cannot set p3 or subsequent parameters.
- For details on RGB values, see “Description” of the SColorIO command.

**SAlmMarkCom**

Alarm Mark (/MC)
Sets the display of the marker that indicates the specified alarm position of a communication channel.

**Syntax**

SAlmMarkCom,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13,p14,p15

- **p1**: Channel number
- **p2**: Whether to display the alarm mark on the scale (Off, On)
- **p3**: Alarm mark type
  - Alarm: Display the default alarm mark
  - Fixed: Display the mark with the specified color
- **p4**: R value of the RGB mark colors for alarm 1 (0 to 255)
- **p5**: G value of the RGB mark colors for alarm 1 (0 to 255)
- **p6**: B value of the RGB mark colors for alarm 1 (0 to 255)
- **p7**: R value of the RGB mark colors for alarm 2 (0 to 255)
- **p8**: G value of the RGB mark colors for alarm 2 (0 to 255)
- **p9**: B value of the RGB mark colors for alarm 2 (0 to 255)
- **p10**: R value of the RGB mark colors for alarm 3 (0 to 255)
- **p11**: G value of the RGB mark colors for alarm 3 (0 to 255)
- **p12**: B value of the RGB mark colors for alarm 3 (0 to 255)
- **p13**: R value of the RGB mark colors for alarm 4 (0 to 255)
- **p14**: G value of the RGB mark colors for alarm 4 (0 to 255)
- **p15**: B value of the RGB mark colors for alarm 4 (0 to 255)

**Query**

SAlmMarkCom[,p1]?

**Example**

Display the alarm marks for alarms 1 to 4 of communication channel 025 in fixed colors red, brown, orange, and yellow, respectively.

SAlmMarkCom,025,On,Fixed,255,165,42,255,165,0,255,255,0

**Description**

- For details on RGB values, see “Description” of the SColorIO command.
### SCalibUseCom

**Calibration Correction Use/Not**
Sets whether to use Calibration Correction of communication channels.

**Syntax**
```
SCalibUseCom, p1, p2
```
- **p1** Channel number
- **p2** Use/Not
  - Off
  - Not Use
  - On
  - Use

**Query**
```
SCalibUseCom[, p1]?
```

**Example**
Set the Calibration Correction of channel number 001 to use.
```
SCalibUseCom, 001, On
```

**Description**
- There is a limitation on the number of channels that p2 can be set to On.
- If p2=Off in the communication channel on/off setting (SRangeCom), p2 is fixed to Off.
- For communication channels, refer to 2.3.2 Parameter Notation and Range on page 2-12.
- You cannot use this command to configure settings while recording is in progress.

### SCalibCom

**Calibration Correction**
Sets the calibration correction for communication channels.

#### Disable Calibration Correction

**Syntax**
```
SCalibCom, p1, p2
```
- **p1** Channel number
- **p2** Linearizer mode (Off)

**Use Calibration Correction (Linearizer approximation, linearizer bias)**

**Syntax**
```
```
- **p1** Channel number
- **p2** Linearizer mode
- **p3** Number of set points (2 to 12)
- **p4** Input value of uncorrected value 1
- **p5** Instrument correction coefficient 1
- **p6** Sensor correction coefficient 1
- **p7** Input value of uncorrected value 2
- **p8** Instrument correction coefficient 2
- **p9** Sensor correction coefficient 2
- **p10** Input value of uncorrected value 3
- **p11** Instrument correction coefficient 3
- **p12** Sensor correction coefficient 3
- **p13** Input value of uncorrected value 4
- **p14** Instrument correction coefficient 4
- **p15** Sensor correction coefficient 4
- **p16** Input value of uncorrected value 5
- **p17** Instrument correction coefficient 5
- **p18** Sensor correction coefficient 5
- **p19** Input value of uncorrected value 6
- **p20** Instrument correction coefficient 6
- **p21** Sensor correction coefficient 6
- **p22** Input value of uncorrected value 7
- **p23** Instrument correction coefficient 7
- **p24** Sensor correction coefficient 7
- **p25** Input value of uncorrected value 8
- **p26** Instrument correction coefficient 8
- **p27** Sensor correction coefficient 8
- **p28** Input value of uncorrected value 9
- **p29** Instrument correction coefficient 9
- **p30** Sensor correction coefficient 9
- **p31** Input value of uncorrected value 10
- **p32** Instrument correction coefficient 10
- **p33** Sensor correction coefficient 10
- **p34** Input value of uncorrected value 11
- **p35** Instrument correction coefficient 11
- **p36** Sensor correction coefficient 11
- **p37** Input value of uncorrected value 12
- **p38** Instrument correction coefficient 12
- **p39** Sensor correction coefficient 12

**Query**
```
SCalibIO[, p1]?
```
Example Set three set points on communication channel 001 (measurement range: 0 to 100.0). Set the set points as follows: when the input value is 0.0, the output value is 0.1; when the input value is 50.0, the output value is 50.2; when the input value is 100.0, the output value is 99.7.

SCalibCom,001,Appro,3,0,1,50,1000,997

Description
- If p2=Off, you cannot set p3 or subsequent parameters.
- If calibration correction use on/off (p2 of the SCalibUseCom command) is set to Off, p2 is fixed to Off.
- You cannot specify set points beyond the number of points specified by p3.
- The correction value is not affected by the range span. It is valid in the range of -9999999 to 99999999.

SAlmLimit
Rate-of-Change Alarm Interval
Sets the rate-of-change interval of the rate-of-change alarm.

Syntax
SAlmLimit,p1,p2
p1 Interval for the low limit on rate-of-change alarm
1 to 32 Integer multiple of the scan interval
p2 Interval for the high limit on rate-of-change alarm
1 to 32 Integer multiple of the scan interval

Query SAlmLimit?

Example Set the intervals for the low limit on rate-of-change alarm and high limit on rate-of-change alarm to 10 times and 20 times the scan interval, respectively.
SAlmLimit,10,20

Description
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

SIndivAlmACK
Individual Alarm ACK
Enables or disables the individual alarm ACK function.

Syntax
SIndivAlmACK,p1
p1 Enable or disable (Off, On)

Query SIndivAlmACK?

Example Enable the individual alarm ACK function.
SIndivAlmACK,On

Description
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=Off, you cannot set p3 or subsequent parameters.

STimer
Timer
Sets a timer.

Do Not Use Timers

Syntax
STimer,p1,p2
p1 Timer number (1 to 12)
p2 Timer type (Off)

Relative Timer

Syntax
STimer,p1,p2,p3,p4,p5,p6
p1 Timer number (1 to 12)
p2 Timer type (Relative)
p3 Interval: Days (0 to 31)
p4 Interval: Hours (HH) (00 to 23)
p5 Interval: Minutes (MM) (00 to 59)
p6 Reset on Math start (Off, On)

Absolute Timer

Syntax
STimer,p1,p2,p3,p4,p5
p1 Timer number (1 to 12)
p2 Timer type (Absolute)
p3 Interval (1min, 2min, 3min, 4min, 5min, 6min, 10min, 12min, 15min, 20min, 30min, 1h, 2h, 3h, 4h, 6h, 8h, 12h, 24h)
p4 Reference time: Hours (HH) (00 to 23)
p5 Reference time: Minutes (MM) (00 to 59)

Query STimer[,]?

Example Set timer number 2 to relative timer at 6 hours 30 minutes. Reset the timer when computation starts.
STimer,2,Relative,0,6,30,On
• If p2=Relative and p3=0, you cannot set “00:00” (for p4 and p5).

### SMatchTimer

**Match Time Timer**

Sets a match time timer.

**Do Not Use Match Time Timers**

**Syntax**

```
SMatchTimer,p1,p2
```

- **p1** Match time timer number (1 to 12)
- **p2** Type (Off)

**Syntax**

```
SMatchTimer,p1,p2,p3,p4,p5,p6,p7
```

- **p1** Match time timer number (1 to 12)
- **p2** Type (Year)
- **p3** Start time: Month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec)
- **p4** Start time: Day (1 to 31, depends on the month)
- **p5** Interval: Hours (HH) (00 to 23)
- **p6** Interval: Minutes (MM) (00 to 59)
- **p7** Timer action
  - Single
  - Repeat

**Syntax**

```
SMatchTimer,p1,p2,p3,p4,p5,p6
```

- **p1** Match time timer number (1 to 12)
- **p2** Type (Month)
- **p3** Start time: Day (1 to 28)
- **p4** Interval: Hours (HH) (00 to 23)
- **p5** Interval: Minutes (MM) (00 to 59)
- **p6** Timer action
  - Single
  - Repeat

**Syntax**

```
SMatchTimer,p1,p2,p3,p4,p5,p6
```

- **p1** Match time timer number (1 to 12)
- **p2** Type (Day)
- **p3** Start time: Day of week
  - Sun
  - Mon
  - Tue
  - Wed
  - Thu
  - Fri
  - Sat
- **p4** Interval: Hours (HH) (00 to 23)
- **p5** Interval: Minutes (MM) (00 to 59)
- **p6** Timer action
  - Single
  - Repeat

**Query**

```
SMatchTimer[,p1]
```

**Example**

Sets match time timer number 2 to a timer that operates on 21 hours 30 minutes on April 17 every year.

```
SMatchTimer,2,Year,Apr,17,21,30,Repeat
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=Off, you cannot set p3 or subsequent parameters.

### SEventAct

**Event Action**

Sets an event action.

**Syntax**

```
SEventAct,p1,p2,p3,p4,p5,p6,p7
```

- **p1** Event action number (1 to 50)
- **p2** Type (Off, On)
- **p3** Event type (see the table below)
- **p4** Source element number (see the table below)
- **p5** Event details (see the table below)
- **p6** Operation mode (see the table below)
- **p7** Action type (see the table below)
- **p8** Source element number (see the table below)
- **p9** Action detail 1 (see the table below)
- **p10** Action detail 2 (see the table below)
- **p11** Action detail 3 (see the table below)
### 2.4 Setting Commands

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Value</th>
<th>p5 Event details</th>
<th>Operation mode</th>
</tr>

</table>

1 Can be output only to DO whose type is set to Manual.
2 Can be output only to SW whose type is set to Manual.
3 Valid when the advanced security function (IAS) is disabled.
4 For the setting range, see section 2.3.2, “Parameter Notation and Range.”
5 This is valid only for the program control function (PG).

**Query**

SEventAct[,p1]?

Invalid parameters are returned as blanks in queries.

**Example**

Execute memory start on the rising edge of the remote control input (channel 0101). Use event action number 2.

SEventAct,2,On,DI,0101,,Rising,Memory,Start
Description

- There are limitations to event and action combinations. For details, see section 1.14 in the Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN) or section 2.15, “Configuring the Event Action Function,” in the Data Acquisition System GM User’s Manual (IM 04L55B01-01EN).
- Write only delimiters (commas) for irrelevant parameters (invalid even if a value is specified).
- Event type “DI” is the channel of the DI module that has been set to remote module (SModeDI command).
- You can specify p3 = Status and p6 = Both when an item that can be specified as an action (flag, DO channel, or internal switch) is valid.
- Math channel and flag are an option (/MT).
- Communication channels are an option (/MC).

### SReport

**Report Type (/MT)**

Sets the type of report to create.

**No Reports**

**Syntax**  
SReport,p1  
p1  Type (Off)

**Hourly and Daily Reports**

**Syntax**  
SReport,p1,p2  
p1  Type (Hour+Day)  
p2  Time to create reports: Hour (HH) (00 to 23)

**Daily and Weekly Reports**

**Syntax**  
SReport,p1,p2,p3  
p1  Type (Day+Week)  
p2  Day to create reports (Mon, Tue, Wed, Thu, Fri, Sat, Sun)  
p3  Time to create reports: Hour (HH) (00 to 23)

**Daily and Monthly Reports**

**Syntax**  
SReport,p1,p2,p3  
p1  Type (Day+Month)  
p2  Day to create reports (1 to 28)  
p3  Time to create reports: Hour (HH) (00 to 23)

**Batch Reports**

**Syntax**  
SReport,p1,p2  
p1  Type (Batch)  
p2  Recording interval (2min, 3min, 4min, 5min, 10min, 15min, 30min, 1h)

**Day Custom Reports**

**Syntax**  
SReport,p1,p2,p3,p4,p5  
p1  Type (Custom)  
p2  Recording interval (2min, 3min, 4min, 5min, 10min, 15min, 30min, 1h)  
p3  File creation interval (4h, 6h, 8h, 12h, 24h)  
p4  Time to create reports: Hour (HH) (00 to 23)  
p5  Time to create reports: Minute (MM) (00 to 59)

**Query**  
SReport[,p1]?

**Example**  
Create daily reports at 09:00 every day and monthly reports at 09:00 on the first day of each month.

SReport,Day+Month,1,09

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p1=Off, you cannot set p2 or subsequent parameters.
### SRepData

**Report Data (/MT)**

Sets the data type and file type of reports.

**Syntax**

```
SRepData, p1, p2, p3, p4, p5, p6
```

**p1**

- Data type 1 (Max, Min, Ave, Sum, Inst)
- Off

**p2**

- Data type 2 (Off, Max, Min, Ave, Sum, Inst)
- Off

**p3**

- Data type 3 (Off, Max, Min, Ave, Sum, Inst)
- Off

**p4**

- Data type 4 (Off, Max, Min, Ave, Sum, Inst)
- Off

**p5**

- Data type 5 (Off, Max, Min, Ave, Sum, Inst)
- Off

**p6**

- File type
  - Combine: 1 file
  - Separate: Separate

**Query**

```
SRepData?
```

**Example**

Record the maximum, minimum, and average values in daily and monthly reports. Generate the daily and monthly reports in a single file.

```
SRepData, Max, Min, Ave, Off, Combine
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

### SDigitalSign

**Electronic Signature Inclusion (/MT)**

Sets whether to include an electronic signature in report template output PDF files.

**Syntax**

```
SDigitalSign, p1, p2
```

**p1**

- Signature target (PDF)

**p2**

- Electronic signature inclusion (Off, On)

**Query**

```
SDigitalSign[p1]?
```

**Example**

Include an electronic signature in report template output PDF files.

```
SDigitalSign[PDF, On]
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

### SRepCh

**Report Channel (/MT)**

Assigns a channel to a report channel.

**Not Assign a Channel**

**Syntax**

```
SRepCh, p1, p2
```

**p1**

- Report Channel Number

**p2**

- Usage (Off)

**Assign a Channel**

**Syntax**

```
SRepCh, p1, p2, p3, p4
```

**p1**

- Report Channel Number

**p2**

- Usage
  - IO: I/O channel
  - Math: Math channel
  - Com: Communication channel

**p3**

- Channel number

**p4**

- Sum scale (Off, /sec, /min, /hour, /day)

**Query**

```
SRepCh[, p1]?
```

**Example**

Assign I/O channel 0002 to report channel 1. Set the sum scale to Off.

```
SRepCh, 001, IO, 0002, Off
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p2=Off, you cannot set p3 or subsequent parameters.
- Communication channels are an option (/MC).
- If the measurement mode is dual interval, the number of channels is halved.
- If the measurement mode is set to high speed or dual interval, and the scan interval is 50 ms or less, the number of channels must be within their limits.

---

**Note:**

- **SRepTemp**
- **SRepCh**
- **SDigitalSign**
**SRepBatchInfo**

**Batch information output (MT)**
Sets the batch information output.

**Syntax**

```
SRepBatchInfo,p1
```

- `p1` Batch information output (Off, On)
  - Off Disabled
  - On Enabled

**Query**

```
SRepBatchInfo?
```

**Example**

```
Output batch information.
SRepBatchInfo,On
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

**SViewAngle**

**View Angle [GX/GP]**
Set the view angle.

**Syntax**

```
SViewAngle,p1
```

- `p1` View Angle
  - Upper Easy to view from above
  - Lower Easy to view from below

**Query**

```
SViewAngle?
```

**Example**

```
Set the view angle so that it is easy to view from above.
SViewAngle,Upper
```

**SBackColor**

**Screen Background Color [GX/GP]**
Sets the screen background color.

**Syntax**

```
SBackColor,p1,p2,p3
```

- `p1` R value of RGB background colors (0 to 255)
- `p2` G value of RGB background colors (0 to 255)
- `p3` B value of RGB background colors (0 to 255)

**Query**

```
SBackColor?
```

**Example**

```
Set the background color to black.
SBackColor,0,0,0
```

**Description**

- For details on RGB values, see “Description” of the **SColorIO** command.

**SGrpChange**

**Automatic Group Switching Time [GX/GP]**
Sets the time for automatically switching between display groups.

**Syntax**

```
SGrpChange,p1
```

- `p1` Automatic group switching time (5s, 10s, 20s, 30s, 1min)

**Query**

```
SGrpChange?
```

**Example**

```
Set the switching time to 1 minute.
SGrpChange,1min
```

**SAutoJump**

**Jump Default Display Operation [GX/GP]**
Sets the amount of time that must elapse until the GX/GP returns to the specified screen (standard screen) when there is no user interaction.

**Syntax**

```
SAutoJump,p1
```

- `p1` Jump default display operation (Off, 1min, 2min, 5min, 10min, 20min, 30min, 1h)

**Query**

```
SAutoJump?
```

**Example**

```
Set the automatic return time to 5 minutes.
SAutoJump,5min
```
### SCalFormat

**Calendar Display Format [GX/GP]**

Sets the calendar display format.

**Syntax**

```
SCalFormat, p1
```

- `p1`: 1st weekday (Sun, Mon)

**Query**

```
SCalFormat?
```

**Example**

Set the first weekday to Monday.

```
SCalFormat, Mon
```

### SBarDirect

**Bar Graph Display Direction [GX/GP]**

Sets the bar graph display direction.

**Syntax**

```
SBarDirect, p1
```

- `p1`: Direction
  - Horizontal
  - Vertical

**Query**

```
SBarDirect?
```

**Example**

Display bar graphs horizontally.

```
SBarDirect, Horizontal
```

### SChgMonitor

**Value Modification from the Monitor**

Enables or disables the feature that allows values to be changed from the monitor.

**Syntax**

```
SChgMonitor, p1
```

- `p1`: Disable or enable (Off, On)

**Query**

```
SChgMonitor?
```

**Example**

Enable the feature that allows values to be changed from the monitor.

```
SChgMonitor, On
```

### STrdWave

**Trend Waveform Display [GX/GP]**

Sets the trend waveform display mode.

**Syntax**

```
STrdWave, p1, p2
```

- `p1`: Waveform display direction
  - Horizontal
  - Vertical
- `p2`: Trend clear
  - Off
  - On
  - Do not clear
  - Clear

**Query**

```
STrdWave?
```

**Example**

Set the trend waveform to horizontal display and clear the waveform when recording is started.

```
STrdWave, Vertical, On
```

**Description**

- When the multi batch function (/BT) is enabled, `p2` is fixed to On.

---

### STrdScale

**Scale [GX/GP]**

Set the scale.

**Syntax**

```
STrdScale, p1, p2, p3
```

- `p1`: Number of digits to display for scale values.
  - Normal
  - Fine
- `p2`: Current value display
  - Mark
  - Bar
- `p3`: Number of digits to display for channels that are added to the current value mark
  - 0-digit
  - 3-digit
  - 4-digit

**Query**

```
STrdScale?
```

**Example**

Set the number of digits to display for scale values to “Fine,” display the value indicators on a bar graph, and set the number of digits to display for channels that are added to the current value mark to 4 digits.

```
STrdScale, Fine, Bar, 4-digit
```

### STrdLine

**Trend Line Width, Grid [GX/GP]**

Sets the trend waveform line width and the grid in the display area.

**Syntax**

```
STrdLine, p1, p2
```

- `p1`: Line width
  - Thick
  - Normal
  - Thin
- `p2`: Grid
  - Auto
  - 4 to 12

**Query**

```
STrdLine?
```

**Example**

Set the trend waveform line width to “Thin” and the number of grid lines to 10.

```
STrdLine, Thin, 10
```
2.4 Setting Commands

**STrdRate**

Trend Interval Switching [GX/GP]

Sets the trend interval switching.

**Syntax**

```plaintext
STrdRate,p1,p2
```

- **p1** Trend interval switching
  - Off Not switch
  - On Switch

- **p2** Second trend interval (5s, 10s, 15s, 30s, 1min, 2min, 5min, 10min, 15min, 20min, 30min, 1h, 2h, 4h, 10h).

**Query**

```plaintext
STrdRate?
```

**Example**

Set the second trend interval to 30 seconds.

```plaintext
STrdRate,On,30s
```

**Description**

- You cannot set parameter p1 while recording is in progress.
- You cannot set parameter p1 while computation is in progress.
- p2 is valid only when p1=On.
- You cannot choose a second trend interval that is shorter than the scan interval.
- Trend intervals shorter than 30 s cannot be specified if an electro-magnetic relay type analog input module is in use (set up).
- When the multi batch function (/BT) is enabled, p1 is fixed to On.
- You cannot use this command to configure settings when the measurement mode is set to high speed or dual interval.

**STrdKind**

Trend Type [GX/GP]

Sets the type of trend waveform to display.

**Syntax**

```plaintext
STrdKind,p1
```

- **p1** Type
  - Fixed to "T-Y"

**Query**

```plaintext
STrdKind?
```

**Example**

Display using rectangular coordinates.

```plaintext
STrdKind,T-Y
```

**SMsgBasic**

Message Writing

Sets the message writing operation.

**Syntax**

```plaintext
SMsgBasic,p1,p2,p3
```

- **p1** Message writing method
  - (GX/GP: Common, Separate)
  - (GM: Common)
  - Common Write messages to all display groups.
  - Separate Write messages to only the groups that are displayed.

- **p2** Power failure message (Off, On)

- **p3** Change message (Off, On)
  - (GX/GP: On, Off)
  - (GM: On, Off, Fixed to Off when the advanced security function (/AS) is disabled)

**Query**

```plaintext
SMsgBasic?
```

**Example**

Write messages to only the groups that are displayed. Enable the power failure message and change message.

```plaintext
SMsgBasic,Separate,On,On
```

**SGroup**

Display Group

Sets the display group.

**Syntax**

```plaintext
SGroup,p1,p2,p3,p4
```

- **p1** Group number
- **p2** Enable or disable (Off, On)
- **p3** Group name (up to 16 characters, UTF-8)
- **p4** Channel string
  - Specify using channel numbers. 4-digit numbers for I/O channels. Numbers that start with “A” for math channels (A015). Numbers that start with “C” for communication channels (C020). The maximum number of characters per channel is 4.
  - Use periods to separate channel numbers (see example).

**Query**

```plaintext
SGroup[,p1]?
```

The channel string is output exactly as it is specified.

**Example**

Assign channels 0001, 0003, 0005, A001, and C023 to group 2 and name it “GROUP A.”

```plaintext
SGroup,2,On,’GROUP A’,’1.3.5.A1.C23’
```

**Description**

- This command is valid only when the multi batch function (/BT) is disabled.
- For IO channels in dual interval measurement, only the channels in the scan group specified with the SDualGroup command can be selected for p4.
### STripLine

**Display Group Trip Line**
Sets a trip line for a display group.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STripLine,p1,p2,p3,p4,p5,p6,p7,p8</td>
<td></td>
</tr>
<tr>
<td>p1 Group number</td>
<td></td>
</tr>
<tr>
<td>p2 Trip line number (1 to 4)</td>
<td></td>
</tr>
<tr>
<td>p3 Enable or disable (Off, On)</td>
<td></td>
</tr>
<tr>
<td>p4 Display position [%] (1 to 100)</td>
<td></td>
</tr>
<tr>
<td>p5 R value of RGB display colors (0 to 255)</td>
<td></td>
</tr>
<tr>
<td>p6 G value of RGB display colors (0 to 255)</td>
<td></td>
</tr>
<tr>
<td>p7 B value of RGB display colors (0 to 255)</td>
<td></td>
</tr>
<tr>
<td>p8 Line width (GX/GP: Thin, Normal, Thick) (GM: Normal)</td>
<td></td>
</tr>
<tr>
<td>Thin</td>
<td>Thin</td>
</tr>
<tr>
<td>Normal</td>
<td>Normal</td>
</tr>
<tr>
<td>Thick</td>
<td>Thick</td>
</tr>
</tbody>
</table>

**Query**
STripLine[,p1[,p2]]?

**Example**
Display trip line 2 using a thick line in red at the 80% position of group 2.
STripLine,2,2,On,80,255,0,0,Thick

**Description**
- For details on RGB values, see “Description” of the SColorIO command.
- This command is valid only when the multi batch function (/BT) is disabled.

### STimeZone

**Time Zone**
Sets the time zone.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STimeZone,p1,p2</td>
<td></td>
</tr>
<tr>
<td>p1 Time zone: Hour (-13 to 13)</td>
<td></td>
</tr>
<tr>
<td>p2 Time zone: Minute (0 to 59)</td>
<td></td>
</tr>
</tbody>
</table>

**Query**
STimeZone?

**Example**
Set the time offset to 9 hours ahead of GMT.
STimeZone,9,0

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

### SSclBmp

**Scale Bitmap Image Usage [GX/GP]**
Sets whether to display a bitmap scale image in the trend display of a display group.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSclBmp,p1,p2</td>
<td></td>
</tr>
<tr>
<td>p1 Group number</td>
<td></td>
</tr>
<tr>
<td>p2 Enable or disable (Off, On)</td>
<td></td>
</tr>
</tbody>
</table>

**Query**
SSclBmp[,p1]?

**Example**
Use a bitmap scale image on display group 3.
SSclBmp,3,On

**Description**
- Specify the bitmap file to use from the front panel of the GX/GP.
- This command is valid only when the multi batch function (/BT) is disabled.

### SMessage

**Message**
Sets messages.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMessage,p1,p2</td>
<td></td>
</tr>
<tr>
<td>p1 Message number (1 to 100)</td>
<td></td>
</tr>
<tr>
<td>p2 Message string (up to 32 characters, UTF-8)</td>
<td></td>
</tr>
</tbody>
</table>

**Query**
SMessage[,p1]?

**Example**
Assign character string “MESSAGE77” to message number 77.
SMessage,77,’MESSAGE77’

### STimeZone

**Date Format**
Sets the date format.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDateFormat,p1,p2,p3</td>
<td></td>
</tr>
<tr>
<td>p1 Date format</td>
<td></td>
</tr>
<tr>
<td>p2 Delimiter</td>
<td></td>
</tr>
<tr>
<td>p3 Month display</td>
<td></td>
</tr>
</tbody>
</table>

**Query**
SDateFormat?

**Example**
SDateFormat,YYMMD,/,D

**Description**
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
### Commands and Responses

#### 2.4 Setting Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Syntax</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>SDst</strong></td>
<td>Daylight Saving Time</td>
<td>Sets the daylight saving time.</td>
<td>SDst, On, Jun, 1st, Sun, 0, Dec, 1st, Sun, 0</td>
</tr>
<tr>
<td><strong>STemp</strong></td>
<td>Temperature Unit</td>
<td>Sets the temperature unit.</td>
<td>STemp, C</td>
</tr>
<tr>
<td><strong>SDPoint</strong></td>
<td>Decimal Point Type</td>
<td>Sets the decimal point type.</td>
<td>SDPoint, Comma</td>
</tr>
<tr>
<td><strong>SFailAct</strong></td>
<td>Fail Relay Operation (/FL) [GX/GP]</td>
<td>Sets the fail relay (DO channel) operation.</td>
<td>SFailAct, Fail</td>
</tr>
</tbody>
</table>

**SLang**

Language

Sets the language to use.

Syntax: `SLang, p1`

Example: Set the language to Japanese. `SLang, Japanese`

Description:
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If you change the language with this command, the recorder may restart.
2.4  Setting Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SFailSts</td>
<td>Instrument Status to Output (/FL) [GX/GP] Sets the instrument status to output from the fail relay (DO channel).</td>
</tr>
<tr>
<td>Syntax</td>
<td>SFailSts, p1, p2, p3, p4, p5</td>
</tr>
<tr>
<td>p1</td>
<td>Memory/media status (Off, On)</td>
</tr>
<tr>
<td>p2</td>
<td>Measurement error (Off, On)</td>
</tr>
<tr>
<td>p3</td>
<td>Communication error (Off, On)</td>
</tr>
<tr>
<td>p4</td>
<td>Recording stop (Off, On)</td>
</tr>
<tr>
<td>p5</td>
<td>Alarm (Off, On)</td>
</tr>
<tr>
<td>Query</td>
<td>SFailSts?</td>
</tr>
<tr>
<td>Example</td>
<td>Output all information. SFailSts, On, On, On, On, On</td>
</tr>
</tbody>
</table>

Description
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLed</td>
<td>LED Indicator Operation [GX/GP] Sets the operation of the LED indicators on the front panel.</td>
</tr>
<tr>
<td>Syntax</td>
<td>SLed, p1, p2</td>
</tr>
<tr>
<td>p1</td>
<td>Type (Function)</td>
</tr>
<tr>
<td>p2</td>
<td>Operation</td>
</tr>
<tr>
<td>p3</td>
<td>Power state</td>
</tr>
<tr>
<td>Query</td>
<td>SLed?</td>
</tr>
<tr>
<td>Example</td>
<td>Set the LED indicator operation to “Alarm.” SLed, Function, AlarmAll</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPrinter</td>
<td>Printer Sets the printer.</td>
</tr>
<tr>
<td>Syntax</td>
<td>SPrinter, p1, p2, p3, p4, p5, p6, p7</td>
</tr>
<tr>
<td>p1</td>
<td>IP address (0.0.0.0 to 255.255.255.255)</td>
</tr>
<tr>
<td>p2</td>
<td>Paper size (A4, A3, Letter)</td>
</tr>
<tr>
<td>p3</td>
<td>Paper orientation (Horizontal, Vertical)</td>
</tr>
<tr>
<td>p4</td>
<td>Resolution [dpi] (300, 600)</td>
</tr>
<tr>
<td>p5</td>
<td>Number of copies (1 to 10)</td>
</tr>
<tr>
<td>p6</td>
<td>Snapshot (Off, On)</td>
</tr>
<tr>
<td>p7</td>
<td>Fit to page during snapshot printing (Off, On)</td>
</tr>
<tr>
<td>Query</td>
<td>SPrinter?</td>
</tr>
<tr>
<td>Example</td>
<td>Set the IP address to “192.168.111.24,” the paper size to A3, the paper orientation to horizontal, the resolution to 600, the number of copies to 2, and snapshot to On. Print by fitting to page. SPrinter, 192.168.111.24, A3, Horizontal, 600, 2, On, On</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SInstruTag</td>
<td>Instruments Tag Sets tags.</td>
</tr>
<tr>
<td>Syntax</td>
<td>SInstruTag, p1, p2</td>
</tr>
<tr>
<td>p1</td>
<td>Tag (up to 32 characters, UTF-8)</td>
</tr>
<tr>
<td>p2</td>
<td>Tag number (up to 16 characters, ASCII)</td>
</tr>
<tr>
<td>Query</td>
<td>SInstruTag?</td>
</tr>
<tr>
<td>Example</td>
<td>Set the tag to assign to the GX/GP to “GX” and the tag number to “12345.” SInstruTag,'GX','12345'</td>
</tr>
</tbody>
</table>

<table>
<thead>

### SUsbInput

**USB Input Device [GX/GP]**

Specifies the USB input device.

**Syntax**

```
SUsbInput, p1
p1 USB input device type
  Japanese_109 Japanese keyboard
  English_104 English keyboard
  Barcode Bar-code reader
```

**Query**

```
SUsbInput?
```

**Example**

Specify the English keyboard.

```
SUsbInput, English_104
```

**Description**

- This command is valid on models with the /UH USB interface option.
- For the communication commands that you can execute using a bar-code reader, see section 1.18.11, “Setting USB Input Devices (/UH option)” in the Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN).

### SSetComment

**Configuration Changes Comment (/AS)**

Sets whether to enter comments when settings are changed.

**Syntax**

```
SSetComment, p1
p1 Enable/disable configuration changes comment
  On Enter comments when settings are changed.
  Off Do not enter comments when settings are changed.
```

**Query**

```
SSetComment?
```

**Example**

Enter comments when settings are changed.

```
SSetComment, On
```

### SSwitch

**Internal Switch Operation**

Sets the internal switch operation.

**Syntax**

```
SSwitch, p1, p2, p3, p4
p1 Internal switch number (1 to 100)
p2 Output type
  Alarm Output alarms
  Manual Specify the output value
p3 Operation
  And Operate when all set alarms are in the alarm state.
  Or Operate when any of the set alarms are in the alarm state.
p4 Power supply
  Last Output the previous value
  On Output 1
  Off Output 0
```

**Query**

```
SSwitch[, p1]?
```

**Example**

Output an alarm on internal switch 3. Use “OR” logic.

```
SSwitch, 3, Alarm, Or
```

**Description**

- p3 is valid when p2=Alarm.
- p4 is valid when p2 is set to Manual.

### SSerialBasic

**Serial Communication Basics (/C2 or /C3)**

Sets basic serial communication parameters.

**Not Use**

**Syntax**

```
SSerialBasic, p1
p1 Function (Off)
```

**Normal/Bar-code**

**Syntax**

```
SSerialBasic, p1, p2, p3, p4, p5, p6, p7
p1 Function (Normal)
  (GX/GP: Normal, Barcode, Darwin)
  (GM: Normal, Darwin)
p2 Address (1 to 99)
p3 Baud rate [bps] (1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200)
p4 Parity (Odd, Even, None)
p5 Stop bits (1, 2)
p6 Data length [bit] (7, 8)
p7 Handshaking (Off:Off, XON:XON, XON:RS, CS:RS)
```

**Modbus Master and Modbus Slave**

**Syntax**

```
SSerialBasic, p1, p2, p3, p4, p5
p1 Function (Master, Slave)
p2 Address (1 to 247)
p3 Baud rate [bps] (1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200)
p4 Parity (Odd, Even, None)
p5 Stop bits (1, 2)
```

**Query**

```
SSerialBasic?
```

**Example**

Set the baud rate to 9600, the data length to 8, the parity check to ODD, the stop bits to 1, the handshaking to OFF:OFF, the address to 02, and the protocol to NORMAL.

```
SSerialBasic, Normal, 2, 9600, Odd, 1, 8, Off:Off
```

**Description**

- You can set p1=Master only on recorders that have the /MC option.
- The settings specified with this command takes effect with the OSeriApply command. The recorder serial settings do not change until you send the OSeriApply command.
- For the communication commands that you can execute using a bar-code reader, see section 1.18.11, “Setting USB Input Devices (/UH option)” in the Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN).
## 2.4 Setting Commands

### SModMaster

**Modbus Master (/C2/MC or /C3/MC)**

Sets the Modbus master operation.

**Syntax**

```
SModMaster, p1, p2, p3, p4, p5, p6
```

- **p1**: Master function (Off, On)
- **p2**: Read cycle (100ms, 200ms, 500ms, 1s, 2s, 5s, 10s, 20s, 30s, 1min)
- **p3**: Communication timeout (100ms, 200ms, 250ms, 500ms, 1s, 2s, 5s, 10s, 1min)
- **p4**: Gap between messages (Off, 5ms, 10ms, 20ms, 50ms, 100ms)
- **p5**: Recovery action: retransmission (Off, 1, 2, 3, 4, 5, 10, 20)
- **p6**: Recovery action: wait time (Off, 5s, 10s, 30s, 1min, 2min, 5min)

**Query**

`SModMaster?`

**Example**

Set the read cycle to 500ms, the communication timeout to 250ms, the gap between messages to 10ms, the retransmission to 2, and the recovery wait time to 5min.

```
SModMaster, On, 500ms, 250ms, 2, 5min
```

**Description**

- If p2=Read, set the communication channel in p6, p7, and p8.
- Set the same type of channel in p7 and p8.
- Math channels are an option (/MT).

### SModMCmd

**Modbus Master Transmission Command (/C2/MC or /C3/MC)**

Sets a transmit command of the Modbus master.

**Syntax**

```
SModMCmd, p1, p2, p3, p4, p5, p6, p7, p8
```

- **p1**: Command number (1 to 100)
- **p2**: Command type
  - Off: Disable command
  - Write: Write a value to a Modbus register of another device
  - Read: Read a value from a Modbus register of another device
- **p3**: Slave number (1 to 247)
- **p4**: Data type
  - BIT: Bit String data
  - INT16: 16-bit signed integer
  - UINT16: 16-bit unsigned integer
  - INT32_B: 32-bit signed integer (big endian)
  - INT32_L: 32-bit signed integer (little endian)
  - UINT32_B: 32-bit unsigned integer (big endian)
  - UINT32_L: 32-bit unsigned integer (little endian)
  - FLOAT_B: 32-bit floating point (big endian)
  - FLOAT_L: 32-bit floating point (little endian)
- **p5**: Register (1 to 465535)
- **p6**: Channel type
  - IO: I/O channel
  - Math: Math channel
  - Com: Communication channel
- **p7**: First channel
- **p8**: Last channel

**Query**

`SModMCmd[p1]?

**Example**

Register the following command in command number 2: read the 32-bit signed integer data that is assigned to registers 30003 (upper 16 bits) and 30004 (lower 16 bits) in the slave device assigned to address 5 into channel C02.

```
SModMCmd, 2, Read, 5, INT32_B, 30003, Com, 002, 002
```

**Description**

- If p2=Read, set the communication channel in p6, p7, and p8.
- Set the same type of channel in p7 and p8.
- Math channels are an option (/MT).

### SSerialAutoLOut

**Auto Logout for Serial Communication (/C2 or /C3)**

Sets the auto logout function for serial communication.

**Syntax**

```
SSerialAutoLOut, p1
```

- **p1**: Auto logout function (Off, 1min, 2min, 5min, 10min)

**Query**

`SSerialAutoLOut?`

**Example**

Set the auto logout time for users logged in through serial communication to 1 minute.

```
SSerialAutoLOut, 1min
```

**Description**

- Auto logout is applied to users logged in through serial communication when the communication security function is set to Login (p2 of the SSecurity command) and the receiver function setting in the basic serial settings (p1 of the SSerialBasic command) is set to Normal.

### SIpAddress

**IP Address Information**

Sets the IP address information.

**Syntax**

```
SIpAddress, p1, p2, p3
```

- **p1**: IP address (0.0.0.0 to 255.255.255.255)
- **p2**: Subnet mask (0.0.0.0 to 255.255.255.255)
- **p3**: Default gateway (0.0.0.0 to 255.255.255.255)

**Query**

`SIpAddress?`

**Example**

Set the IP address to 192.168.111.24, the subnet mask to 255.255.255.0, and the default gateway to 192.168.111.1.

```
SIpAddress, 192.168.111.24, 255.255.255.0, 192.168.111.1
```
2.4 Setting Commands

**SClient**

**Client Function**
Sets the client function.

**Syntax**

```
SClient,p1,p2
p1 Client type (FTP, SMTP, SNTP, MODBUS, WATT, SLMP)
p2 Client Function (Off, On)
```

**Query**

```
SClient[p1]?
```

**Example**

Use the FTP client function.

```
SClient,FTP,On
```

**Description**

- Modbus client is valid on models with the /MC communication channel option.
- WATT connection client is valid on models with the WT communication (/E2) option.
- SLMP client is valid on models with the SLMP client (/E4) option.

**SDns**

**DNS Information**
Sets the DNS information.

**Host (GX)**

**Syntax**

```
SDns,p1,p2,p3
p1 Setting type (Host)
p2 Host name (up to 64 characters, ASCII)
p3 Domain name (up to 64 characters, ASCII)
```

**DNS Server**

**Syntax**

```
SDns,p1,p2,p3
p1 Setting type (Server)
p2 Primary DNS server (0.0.0.0 to 255.255.255.255)
p3 Secondary DNS server (0.0.0.0 to 255.255.255.255)
```

**Suffix Setup**

**Syntax**

```
SDns,p1,p2,p3
p1 Setting type (Suffix)
p2 Primary domain suffix (up to 64 characters, ASCII)
p3 Secondary domain suffix (up to 64 characters, ASCII)
```

**Example**

Set the IP address of the primary DNS server to 192.168.111.1 and the IP address of the secondary DNS server to 192.168.111.10

```
SDns,Server,192.168.111.1,192.168.111.10
```

**Description**

- The settings specified with this command takes effect with the **OIPApply** command. The recorder IP address does not change until you send the OIPApply command.

**SDhcp**

**DHCP Client**
Sets the DHCP client.

**Do Not Obtain the IP Address Automatically**

**Syntax**

```
SDhcp,p1
p1 Automatic IP address assignment (Off)
```

**Obtain the IP Address Automatically**

**Syntax**

```
SDhcp,p1,p2,p3
p1 Automatic IP address acquisition (On)
p2 DNS information acquisition (Off, On)
p3 Automatic host name registration (Off, On)
```

**Query**

```
SDhcp?
```

**Example**

Automatically obtain the IP address and DNS information and automatically register the host name.

```
SDhcp,On,On,On
```

**Description**

- The settings specified with this command takes effect with the **OIPApply** command. The recorder IP address does not change until you send the OIPApply command.

**SFtpKind**

**File to Transfer via FTP**
Sets the file to transfer via FTP.

**Syntax**

```
SFtpKind,p1,p2
p1 Setting type (GX/GP: Data, Report, Snapshot, AlarmSummary, ManualSample, Setting)
(GM: Data, Report, AlarmSummary, ManualSample, Setting)
```

**Data**

Automatically transfer display and event data files when files are generated.

**Report**

Automatically transfer report data files when files are generated.
2.4 Setting Commands

### Snapshot
Automatically transfer snapshot data files when files are generated.

### AlarmSummary
Transfer alarm summaries.

### ManualSample
Automatically transfer manual sampled data files when manual sampling is executed.

### Setting
Automatically transfer the setting file when settings are changed.

#### Example
For the primary server, assign the name “server1” and port number 21. Set the user name to “Administrator1,” the password to “password1,” and the directory to “directory1.” Set PASV mode to Off.

```
SftpCnct,Primary,'server1',21,'Administrator1','password1','directory1',Off
```

### SftpKind
**SMTP User Authentication**
Sets the SMTP user authentication method.

#### Syntax
```
SsmtpLogin,p1
```

<table>
<thead>
<tr>
<th>p1</th>
<th>User authentication type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Not use authentication.</td>
</tr>
<tr>
<td>Auth-Smtp</td>
<td>Use Authentication SMTP.</td>
</tr>
<tr>
<td>POP3</td>
<td>Use POP Before SMTP (unencrypted).</td>
</tr>
<tr>
<td>APOP</td>
<td>Use POP Before SMTP (encrypted).</td>
</tr>
</tbody>
</table>

#### Query
```
SsmtpLogin?
```

#### Example
Do not use authentication.

```
SsmtpLogin,Off
```

### SftpCnct
**SMTP Client Connection Destination Server**
Sets the SMTP client connection destination server.

#### Syntax
```
SsmtpCnct,p1,p2,p3,p4,p5
```

<table>
<thead>
<tr>
<th>p1</th>
<th>Destination server type (SMTP, POP)</th>
</tr>
</thead>
<tbody>
<tr>
<td>p2</td>
<td>Server name (up to 64 characters, ASCII)</td>
</tr>
<tr>
<td>p3</td>
<td>Port number (1 to 65535)</td>
</tr>
<tr>
<td>p4</td>
<td>User name (up to 32 characters, ASCII)</td>
</tr>
<tr>
<td>p5</td>
<td>Password (up to 32 characters, ASCII)</td>
</tr>
</tbody>
</table>

#### Query
```
SsmtpCnct[p1]?
```

#### Example
Connect to SMTP server “SMTPserver1.” Set the port number to 25, the user name to “administrator1,” and the password to “password1.”

```
SsmtpLogin,SMTP,'SMTPserver1',25,'administrator1','password1'
```

### SMailHead
**Mail Header**
Sets the mail header including the recipient address.

#### Syntax
```
SMailHead,p1,p2,p3,p4
```

<table>
<thead>
<tr>
<th>p1</th>
<th>Sender address (up to 64 characters, ASCII)</th>
</tr>
</thead>
<tbody>
<tr>
<td>p2</td>
<td>Recipient address 1 (up to 150 characters, ASCII)</td>
</tr>
<tr>
<td>p3</td>
<td>Recipient address 2 (up to 150 characters, ASCII)</td>
</tr>
<tr>
<td>p4</td>
<td>Character string to add to the subject (up to 32 characters, ASCII)</td>
</tr>
</tbody>
</table>

#### Query
```
SMailHead?
```

---

**SFtpKind**
**FTP Transfer Time Shift**
Sets the amount of time to shift file transfers that are carried out by the FTP client function.

#### Syntax
```
SFtpTime,p1,p2
```

<table>
<thead>
<tr>
<th>p1</th>
<th>Setting type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>Display and event data files</td>
</tr>
<tr>
<td>Report</td>
<td>Report files</td>
</tr>
</tbody>
</table>

| p2  | Transfer shift time [minutes] (0 to 120) |

#### Query
```
SFtpTime[p1]?
```

#### Example
Shift (delay) FTP transfers of report data files by 30 minutes.

```
SFtpTime,Report,30
```

#### Description
- The report function is an option (/MT).
- p1 can be set to Setting when the advanced security function (/AS) is enabled.

---

**SFtpCnct**
**FTP Client Connection Destination Server**
Sets the FTP client connection destination server.

#### Syntax
```
SFtpCnct,p1,p2,p3,p4,p5,p6,p7
```

<table>
<thead>
<tr>
<th>p1</th>
<th>Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Primary</td>
</tr>
<tr>
<td>Secondary</td>
<td>Secondary</td>
</tr>
<tr>
<td>p2</td>
<td>Server name (up to 64 characters, ASCII)</td>
</tr>
<tr>
<td>p3</td>
<td>Port number (1 to 65535)</td>
</tr>
<tr>
<td>p4</td>
<td>User name (up to 32 characters, ASCII)</td>
</tr>
<tr>
<td>p5</td>
<td>Password (up to 32 characters, ASCII)</td>
</tr>
<tr>
<td>p6</td>
<td>Directory name (up to 64 characters, ASCII)</td>
</tr>
<tr>
<td>p7</td>
<td>PASV mode (Off, On)</td>
</tr>
</tbody>
</table>

#### Query
```
SFtpCnct[p1]?
```

The password is displayed using asterisks.
Example
Set the sender address to "recorder1@data.com" and the recipient address to "pc1@data.com." Add "part1" to the subject.

SMailHead,'recorder1@data.com','pc1@data.com','part1'

SMailBasic
Common Section of the Mail Body
Sets the items that are common to the body of all mails.
Syntax
SMailBasic,p1,p2
p1 Header string (up to 128 characters, UTF-8)
p2 Include source URL (Off, On)
Query
SMailBasic?
Example
Set the header to "recorder1," and include the source URL.
SMailBasic,'recorder1',On

SMail
Destination and Behavior for Each Mail Type
Sets the destination and behavior for each mail type.
Alarm Notification
Syntax
SMail,p1,p2,p3,p4,p5,p6
p1 Setting type (Alarm)
p2 Recipient (Off, 1, 2, 1+2)
Off Not send
1 Send to recipient 1
2 Send to recipient 1 and 2
p3 Inclusion of instantaneous data (Off, On)
On Send mails when alarms occur
On+Off Send mails when alarms occur and when they are cleared
p4 Alarm action
On Send mails when alarms occur
On+Off Send mails when alarms occur and when they are cleared
p5 Inclusion of tag number or channel number in subject (Off, On)
Scheduled Transmission
Syntax
SMail,p1,p2,p3
p1 Setting type (Time)
p2 Recipient (Off, 1, 2, 1+2)
p3 Inclusion of instantaneous data (Off, On)
Report Notification (/MT)
Syntax
SMail,p1,p2
p1 Setting type (Report)
p2 Recipient (Off, 1, 2, 1+2)
Media Alarm Notification
Syntax
SMail,p1,p2
p1 Setting type (Media)
p2 Recipient (Off, 1, 2, 1+2)
Power failure notification
Syntax
SMail,p1,p2
p1 Setting type (Power)
p2 Recipient (Off, 1, 2, 1+2)
System Error Notification
Syntax
SMail,p1,p2
p1 Setting type (System)
p2 Recipient (Off, 1, 2, 1+2)
User Lockout Notification (/AS)
Syntax
SMail,p1,p2
p1 Setting type (UserLock)
p2 Recipient (Off, 1, 2, 1+2)
Query
SMail[p1]?
Example
Send alarm notifications to recipient 1 when alarms occur and when they are cleared. Include instantaneous data at the time of transmission, and include the tag number or channel number in the subject.
SMail,Alarm,1,On,On+Off,On
Description
• The report function is an option (/MT).

SMailAlarm
Alarm Notification Mail Target Channels
Detects the alarm status of the specified channels and sends alarm notifications.
Syntax
SMailAlarm,p1
p1 Channel string (up to 249 characters, up to 50 channels)
• Use channel number to specify the channels. 4-digit numbers for I/O channels. Numbers that start with “A” for math channels (A015). Numbers that start with “C” for communication channels (C020). The maximum number of characters per channel is 4.
• Use periods to separate channel numbers (see example).
• To specify all channels from the first channel to the last channel, delimit the channels with a hyphen. An error will occur if there are no valid channels in the hyphen designated channels.
Query
SMailAlarm?
The channel string is output exactly as it is specified.
Example
Set the target channels to channels 0001 to 0021, 0101, A025, and C003.

SMailAlarmLevel
Alarm Notification Mail Target Alarm levels
Detects the alarm status of the specified alarm levels and sends alarm notification mails.
Syntax
SMailAlarmLevel,p1,p2,p3,p4
p1 Alarm level 1 (On, Off)
p2 Alarm level 2 (On, Off)
p3 Alarm level 3 (On, Off)
p4 Alarm level 4 (On, Off)
Query
SMailAlarmLevel?
Example
Set the target alarm levels 1 and 2 to On, 3 and 4 to Off.
SMailAlarmLevel,On,On,Off,Off
2.4 Setting Commands

**SMailAlarmDetect**

**Alarm Notification Mail Target Alarm Detection Method**
Sets the alarm detection method for the alarm notification mail.

**Syntax**
SMailAlarmDetect,p1
  p1 Detection method (Ch, Level)

**Query**
SMailAlarmDetect?

**Example**
Use alarm levels to specify the target alarms.
SMailAlarmDetect,Level

**Description**
- When p1=Ch, use SMailAlarm command to set the target channels. When p1=Level, use SMailAlarmLevel command to set the target levels.

**SMailTime**

**Scheduled Transmission Times**
Sets the scheduled transmission times.

**Syntax**
SMailTime,p1,p2,p3,p4
  p1 Recipient (1 or 2)
  p2 Reference time: Hours (HH) (00 to 23)
  p3 Reference time: Minutes (MM) (00 to 59)
  p4 Interval (1h, 2h, 3h, 4h, 6h, 8h, 12h, 24h)

**Query**
SMailTime,[p1]?

**Example**
Send mail to recipient 1 every day at 08:30.
SMailTime,1,08,30,24

**SSntpCnct**

**SNTP Client**
Sets the SNTP client operation and the connection destination server.

**Syntax**
SSntpCnct,p1,p2,p3,p4,p5,p6,p7
  p1 Server name (up to 64 characters, ASCII)
  p2 Port number (1 to 65535)
  p3 Reference time: Hours (HH) (00 to 23)
  p4 Reference time: Minutes (MM) (00 to 59)
  p5 Access interval (6h, 12h, 24h)
  p6 Timeout (10s, 30s, 90s)
  p7 Time adjust on start action (Off, On)

**Query**
SSntpCnct?

**Example**
Set the server name to “sntpserver1,” the port number to “123,” the timeout to 30s. Query the time every day at 12:00 and at memory start.
SSntpCnct,’sntpserver1’,123,12,00,24,30s,On

**SModClient**

**Modbus Client Operation (/MC)**
Sets the Modbus client operation.

**Syntax**
SModClient,p1,p2,p3,p4
  p1 Read cycle (100ms, 200ms, 500ms, 1s, 2s, 5s, 10s 20s, 30s, 1min)
  p2 Recovery wait time (Off, 5s, 10s, 30s, 1min, 2min, 5min)
  p3 Keep connection (Off, On)
  p4 Connection timeout [s] (1 to 10)

**Query**
SModClient?

**Example**
Set the read cycle to 100ms, the recovery wait time to Off, and the connection timeout to 1 second.
SModClient,100ms,off,on,1

**Description**
- This command is valid on models with the /MC communication channel option.

**SModCLList**

**Modbus Client Connection Destination Server (/MC)**
Sets the Modbus client connection destination server.

**Syntax**
SModCLList,p1,p2,p3
  p1 Registration number
  p2 Server name (up to 64 characters, ASCII)
  p3 Port number (1 to 65535)

**Query**
SModCLList[,p1]?

**Example**
Assign server name “recorder1” and port number “502” to registration number 1.
SModClient,1,’recorder1’,502

**SModCCmd**

**Modbus Client Transmission Command (/MC)**
Sets the Modbus client transmission command.

**Syntax**
SModCCmd,p1,p2,p3,p4,p5,p6,p7,p8,p9
  p1 Command number
  p2 Command type
    Off Disable command
    Write Write a value to a Modbus register of another device.
    Read Read a value from a Modbus register of another device.
  p3 Server number (1 to 16)
  p4 Unit number (1 to 255)
  p5 Data type
    BIT Bit String data
    UINT16 16-bit signed integer
    INT32_B 32-bit signed integer (big endian)
    INT32_L 32-bit signed integer (little endian)
    UINT32_B 32-bit unsigned integer (big endian)
    UINT32_L 32-bit unsigned integer (little endian)
    FLOAT_B 32-bit floating point (big endian)
    FLOAT_L 32-bit floating point (little endian)
  p6 Register (1 to 465535)
Commands and Responses

1

p7 Channel type
1O I/O channel
Math Math channel
Com Communication channel
p8 First channel
p9 Last channel
Query SModCmd[p1]?
Example Register the following command in command number 2: read the 32-bit signed integer data that is assigned to registers 30003 (upper 16 bits) and 30004 (lower 16 bits) in the server device assigned to address 5 and unit number 1 into channel C002.
SModCmd,2,Read,5,1,INT32_B,30003,Com,C002,C002

Description
• If p2=Read, set the communication channel in p7, p8, and p9.
• Set the same type of channel in p8 and p9.
• Math channels are an option (/MT).
• For details on data types, registers, and channel types, see section 4.5.1, “Modbus Client and Master Function” in the Model GX10/GX20/GP10/GP20 Paperless Recorder User’s Manual (IM 04L51B01-01EN) or section 4.5.1, “Modbus Client/Master Function,” in the Data Acquisition System GM User’s Manual (IM 04L55B01-01EN).

SServer

Server Function
Enables or disables the server function.
Syntax SServer,p1,p2,p3
p1 Server type (FTP, HTTP, SNTP, MODBUS, GENE, EtherNetIP, DARWIN, OPC-UA)
GENE General communication
p2 Operation (Off, On)
QUARE SServer[,]p1]?
Example Use the FTP server function.
SServer,FTP,On

Description
• You cannot specify a port number that is used by another function.
• p3 cannot be set to 44818, 2222, 34150, or 34151.
• p3 is invalid when p1 = DARWIN (Darwin compatible communication) or when p1 = EtherNetIP.
• The default port numbers are listed below.

<table>
<thead>
<tr>
<th>Server type (p1)</th>
<th>Default port number</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTP</td>
<td>21</td>
</tr>
<tr>
<td>HTTP</td>
<td>80</td>
</tr>
<tr>
<td>SNTP</td>
<td>123</td>
</tr>
<tr>
<td>MODBUS</td>
<td>502</td>
</tr>
<tr>
<td>GENE</td>
<td>34434</td>
</tr>
</tbody>
</table>
• p1 = EtherNetIP is an option (/E1).
• p1=OPC-UA is valid on models with the OPC-UA server (/E3) option.
• The settings specified with this command takes effect with the OIPApply command.

SKeepAlive

Keepalive
Sets the keepalive function.
Syntax SKeepAlive,p1
p1 Operation (Off, On)
Query SKeepAlive?
Example Enable the communication timeout, and set the timeout value to 3 minutes.
STimeOut,On,3

STimeOut

Communication Timeout
Sets the communication timeout function.
Syntax STimeOut,p1,p2
p1 Timeout function (Off, On)
p2 Timeout value [minutes] (1 to 120)
Query STimeOut?
Example Enable the communication timeout, and set the timeout value to 3 minutes.
STimeOut,On,3

SFtpFormat

FTP Server Directory Output Format
Sets the FTP server directory output format.
Syntax SFtpFormat,p1
p1 FTP server directory output format (MS-DOS, UNIX)
Query SFtpFormat?
Example Specify MS-DOS.
SFtpFormat,MS-DOS

SModDelay

Modbus Server Delay Response
Sets the Modbus server delay response.
Syntax SModDelay,p1
p1 Delay response (Off, 10ms, 20ms, 50ms)
Query SModDelay?
Example Specify no delay response.
SModDelay,Off
2.4 Setting Commands

**SModLimit**

Modbus Server Connection Limit

Enables or disables the Modbus server connection limit function.

**Syntax**

```
SModLimit, p1
```

**p1**
Connection limit (Off, On)

**Query**

```
SModLimit?
```

**Example**

Enable connection limit.

```
SModLimit, On
```

**SModList**

IP Address to Allow Connection to Modbus Server

Sets the IP address to allow connection to Modbus server.

**Syntax**

```
SModList, p1, p2, p3
```

**p1**
Registration number (1 to 10)

**p2**
Enable or disable registration (Off, On)

**p3**
IP address (0.0.0.0 to 255.255.255.255)

**Query**

```
SModList[, p1]?
```

**Example**

Register IP address “192.168.111.24” to registration number 1.

```
SModList, 1, On, 192.168.111.24
```

**SWattList**

WT Communication Connection Server (/E2)

Sets the WT communication connection server.

**Syntax**

```
SWattList, p1, p2, p3, p4
```

**p1**
Registration number

**p2**
Enable or disable (On, Off)

**p3**
Server name (up to 64 characters, ASCII)

**p4**
Model (WT300, WT500, WT1800)

**Query**

```
SWattList[, p1]?
```

**Example**

Register model WT1800 and server name “Watt01” in registration number 1.

```
SWattList, 1, On, Watt01, WT1800
```

**SWattClient**

WT Communication Operation (/E2)

Sets the WT communication operation.

**Syntax**

```
SWattClient, p1, p2
```

**p1**
Read cycle (500ms, 1s, 2s, 5s, 10s, 20s, 30s)

**p2**
Recovery wait time (5s, 10s, 30s, 1min, 2min, 5min)

**Query**

```
SWattClient?
```

**Example**

Set the read cycle to 10 seconds and recovery wait time to 2 minutes.

```
SWattClient, 10, 2min
```

**SWattData**

WT Data Allocation to Communication Channel (/E2)

Allocates WT data to a communication channel.

**Syntax**

```
SWattData, p1, p2, p3, p4, p5, p6, p7
```

**p1**
Allocation No

**p2**
Enable or disable specification (On, Off)

**p3**
Communication channel

**p4**
Server registration number

**p5**
Data group name (see “Description” and Appendix 6.)

**p6**
Data name (see Appendix 6.)

**p7**
Exponential scaling (-9 to 18), default value 0

**Query**

```
SWattData[, p1]?
```

**Example**

In allocation number 1, allocate the RMS voltage of element 1 of the WT1800 assigned to server registration number 2 to communication channel 003.

```
SWattData, 1, On, 003, 2, Element1, URMS
```

**Description**

- The available data groups (p5) vary depending on the model.

<table>
<thead>
<tr>

</tbody>
</table>

- For details on the available data groups (p5), see Appendix 6.
### SKdcCnct

**KDC Connection Destination (/AS)**
Sets the KDC server for the password management.

**Syntax**

```
SKdcCnct,p1,p2,p3
```

- `p1` Connection destination (Primary, Secondary)
  - Primary: Primary server
  - Secondary: Secondary server
- `p2` KDC server name (up to 64 characters, ASCII)
- `p3` Port number (1 to 65535)

**Query**

```
SKdcCnct[,p1]?
```

**Example**
For the primary KDC server, assign the server name “KdcControl1” and port number 88.
```
SKdcCnct,Primary,KdcControl1,88
```

### SAuthKey

**Certification Key (/AS)**
Sets the certification key that is used during password management authentication.

**Syntax**

```
SAuthKey,p1,p2,p3,p4
```

- `p1` Host principal (up to 20 characters, ASCII)
- `p2` Realm name (up to 64 characters, ASCII)
- `p3` Password (up to 20 characters, ASCII)
- `p4` Encryption (ARC4, AES128, AES256)

**Query**

```
SAuthKey?
```

**Example**
Set the password of host principal “GX10_001” realm “REALM01” to “gDcbwT5,” and the encryption (the same as the server) to AES128.
```
SAuthKey,GX10_001,REALM01,gDcbwT5,AES128
```

**Description**

- slashes and ampersands cannot be used in `p1` or `p2`.

### SDarwinCnvCh

**Darwin Channel Conversion (Darwin compatible communication)**
Replace Darwin channels with recorder channels.

**Syntax**

```
SDarwinCnvCh,p1
```

- `p1` Darwin model
  - Standalone: Stand-alone type
  - Extension: Extended type

**Query**

```
SDarwinCnvCh?
```

**Example**
Replace DA100 stand-alone type channels to recorder channels.
```
SDarwinCnvCh,Standalone
```

### SDarwinPortLimit

**Port limitation of DARWIN compatible communication**
If port limitation is on, port number 34151 only allows reading of instantaneous data.

**Syntax**

```
SDarwinPortLimit,p1
```

- `p1` Port limitation on/off (On/Off)
  - On: Instantaneous data reading only on port 34151.
  - Off: No limitations on 34150 or 34151.

**Query**

```
SDarwinPortLimit?
```

**Example**
Set port number 34151 to instantaneous data reading only.
```
SDarwinPortLimit,On
```

**Description**

- The following applies when port limitation is set to On.
  - When connected via Ethernet
    Only instantaneous data reading is possible on port number 34151. Configuration, control, and operation are not possible.
  - When connected via serial communication
    Only the commands that can be used on a Ethernet connection through port 34150 are valid.

### SSLMPClient

**SLMP client operation (/E4)**
Sets the SLMP client operation.

**Syntax**

```
SSLMPClient,p1,p2,p3,p4
```

- `p1` Data code (Binary, ASCII)
- `p2` Read cycle (100ms, 200ms, 500ms, 1s, 2s, 5s, 10s, 20s, 30s, 1min)
- `p3` Timeout value (250ms, 500ms, 1s, 2s, 3s, 4s, 5s, 10s, 20s, 30s, 1min)
- `p4` Recovery time (Off, 5s, 10s, 30s, 1min, 2min, 5min)

**Query**

```
SSLMPClient?
```

**Example**
Set the data code to binary, read cycle to 500 ms, timeout value to 1 s, and recovery time to 2 min.
```
SSLMPClient,Binary,500ms,1s,2min
```

### SSLMPList

**SLMP connection destination server (/E4)**
Sets the SLMP client connection destination server.

**Syntax**

```
SSLMPList,p1,p2,p3
```

- `p1` Connection destination number (1 to 16)
- `p2` Server name (up to 64 characters, ASCII)
- `p3` Port number (1 to 65535)

**Query**

```
SSLMPList[,p1]?
```

**Example**
Connect to the server at connection destination number 1. Set the server name to “SMARTDAC” and the port number to 2020.
```
SSLMPList,1,"SMARTDAC",2020
```
SSLMPCCmd

SLMP client transmission command (/E4)

Sets the SLMP client transmission command.

**Syntax**

SSLMPCCmd,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13

- **p1**: Command number (GX10/GP10: 1 to 50, GX20-1/GP20-1: 1 to 100, GX20-2/GP20-2/GM10-2: 1 to 200)
- **p2**: Type
  - Off: Disable command
  - Write: Write a value to a Modbus register of another device.
  - Read: Read a value from a Modbus register of another device.
- **p3**: Connection destination number (1 to 16)
- **p4**: See the device code table.
- **p5**: Request destination network number (0 to 255)
- **p6**: Request destination station number (0 to 255)
- **p7**: Request destination module I/O number (0 to 65535)
- **p8**: Request destination multidrop station number (0 to 31)
- **p9**: Data type
  - BIT: Bit String data
  - INT16: 16-bit signed integer
  - UINT16: 16-bit unsigned integer
  - INT32: 32-bit signed integer
  - UINT32: 32-bit unsigned integer
  - FLOAT: 32-bit floating point
- **p10**: Head device number (0 to 16777215)
- **p11**: Channel type
  - IO: I/O channel
  - Math: Math I/O channel (/IMT)
  - Com: Communication I/O channel (/MC)
- **p12**: First channel
- **p13**: Last channel

**Query**

SSLMPCCmd[,p1]? 

**Example**

Register “read the bit data assigned to head device number 1234 of the internal relay of the device at connection destination server number 1” to command number 1.

SSLMPCCmd,1,Read,1,M,1234,0,255,1023,0,BIT,Com,0001,0001

</table>

**SSecurity**

Security Function

Sets the security function.

**Syntax**

SSecurity,p1,p2,p3,p4,p5,p6

- **p1**: Operations on the recorder
  - Off: Disables the security function
  - Login: Enables the login function
  - Operate: Enables the function that prohibits touch screen operation
- **p2**: Operations via communication (Off, Login)
- **p3**: Auto logout
  - Off: Disables the security function
  - Login: Enables the login function
  - Operate: Enables the function that prohibits touch screen operation
- **p4**: Operation without login
  - Off: Disables the security function
  - On: Enables the login function
- **p5**: Password retry (Off, 3, 5)
### SKdc

**Password Management (/AS)**
Sets the password management.

**Syntax**
```
SKdc,p1,p2
```
- `p1` Enable disable password management (On, Off)
- `p2` Root user password (between 6 and 20 characters, ASCII)

**Query**
```
SKdc?
```

**Example**
Enable password management. Set the root user password to “root3210.”
```
SKdc,On,root3210
```

### SOpePass

**Password to Unlock Operation [GX/GP]**
Sets the password that is used to release the operation lock.

**Syntax**
```
SOpePass,p1
```
- `p1` Password (up to 20 characters, UTF-8)

**Query**
```
SOpePass?
```

**Example**
Set the password to “password1.”
```
SOpePass,‘password1’
```

**Description**
- You cannot use this command to configure settings when logged in as a user (when the user level is User).

---

### SOpeLimit

**Operation Lock Details [GX/GP]**
Sets which operations to lock.

**Syntax**
```
SOpeLimit,p1,p2
```
- `p1` Authority of user
  - Memory
  - Math
  - DataSave
  - Message
  - Batch
  - AlarmACK
  - Comm
  - DispOpe
  - ChangeSet
  - DateSet
  - File
  - System
  - Out
  - CalibSet

- `p2` Free/Lock
  - Free
  - Lock

**Query**
```
SOpeLimit[,p1]?
```

**Example**
Prohibit operations for changing settings.
```
SOpeLimit,ChangeSet,Lock
```

**Description**
- You cannot use this command to configure settings when logged in as a user (when the user level is User).
SUser
User Settings
Register users.
Syntax
SUser, p1, p2, p3, p4, p5, p6, p7
p1 User number
p2 User level
  Off Not Use
  Admin Administrator level
  User User level
p3 Login mode
  (GX/GP: Key, Comm, Key+Comm)
  (GM: Comm)
  Key Log in using touch operation
  Comm Log in via communication (including Web)
  Key+Comm Log in using touch operation and via communication.
p4 User name (up to 20 characters, ASCII)
p5 Password (up to 20 characters, ASCII)
p6 Enable or disable user limitation (Off, On)
p7 User limitation number (1 to 10)
Query
SUser[ , p1 ]?
The password of p5 are displayed using asterisks.
Example
Register a user-level user to user number 3. Set the user name to "user10" and the
password to "pass012." Allow login only using touch operation, and specify user
limitation number 5.
SUser, 3, User, Key, 'user10', 'pass012', On, 5

Description
• If p1=1, p2 is fixed to Admin. In addition, you cannot
  set p3 to Comm.
• If p2=Admin, p6 and p10 are fixed to Off.
• If p2=Monitor, p6, p9, and p10 are fixed to Off.
• You cannot enter NULL or spaces in p4 or p5.
• Setting to enable password management (SKdc
  command)
  • If p2=Off, Admin, or User, p5 is invalid. The response
to a query will be blank.
  • p9 is fixed to Off.
• You can specify p5 only when p2=Monitor.
  When p2=Admin or User, you cannot specify p5
  and the default password is enabled. For the default
  password, see section 2.3.1, “Logging In” in the Model
  GX10/GX20/GP10/GP20 Advanced Security Function
  (AS) User’s Manual (IM 04L51B01-05EN) or section
  2.3.1, “Logging In” in the Data Acquisition System GM
  Advanced Security Function (AS) User’s Manual (IM
  04L55B01-05EN).
• For the characters that you can use in the specified
  password (p5), see Appendix 1.
• You cannot use this command to configure settings
  when logged in as a user (when the user level is
  User).
### SUserLimit

**Authority of User**
Sets user operation limitations.

**Syntax**
```
SUserLimit,p1,p2,p3
```
- `p1` User limitation number (1 to 10)
- `p2` Authority of user

</table>

**Query**
```
SUserLimit[,p1]?
```

**Example**
Set user limitation number 1 so that changing settings is prohibited.
```
SUserLimit,1,ChangeSet,Lock
```

**Description**
- You cannot use this command to configure settings when logged in as a user (when the user level is User).

---

### SSignIn

**Sign In (/AS)**
Sets the sign in record for the measured data file.

**Syntax**
```
SSignIn,p1,p2,p3
```
- `p1` Sign in type (Batch, File)
- `p2` Sign in at record stop (GX/GP: On, Off) (GM: Fixed to Off)
- `p3` FTP transfer timing (GX/GP: DataSave, SignIn) (GM: Fixed to DataSave)

**Query**
```
SSignIn?
```

**Example**
When the recording of measured data of a batch process is stopped, switch to the screen for signing in.
```
SSignIn,Batch,On,SignIn
```

### SSignInTitle

**Sign In Title (/AS)**
Sets the sign in title.

**Syntax**
```
SSignInTitle,p1,p2,p3
```
- `p1` Sign in 1 title (up to 16 alphanumeric and symbol characters)
- `p2` Sign in 2 title (same as above)
- `p3` Sign in 3 title (same as above)

**Query**
```
SSignInTitle?
```

**Example**
Set the sign in 1, 2, and 3 titles to “Operator 1,” “Supervisor 1,” and “Manager 1,” respectively.
```
SSignInTitle,’Operator 1’,’Supervisor 1’,’Manager 1’
```

### SSignInLimit

**Sign In Property (/AS)**
Sets the sign in property.

**Syntax**
```
SSignInLimit,p1,p2,p3,p4
```
- `p1` Sign in property number (1 to 8)
- `p2` Sign in 1 free/lock (Free, Lock)
- `p3` Sign in 2 free/lock (Free, Lock)
- `p4` Sign in 3 free/lock (Free, Lock)

**Query**
```
SSignInLimit[,p1]?
```

**Example**
Set a sign in property number 2 to allow the execution of only sign in 1.
```
SSignInLimit,1,Free,Lock,Lock
```
### SBTPassword

**Bluetooth Password (/C8) [GM]**

Sets the Bluetooth password.

**Syntax**
```
SBTPassword, p1, p2
```
- **p1** Password usage (On, Off)
- **p2** Password (up to 20 characters, ASCII)

**Query**
```
SBTPassword?
```
The password is displayed using asterisks.

**Example**
```
Set the password to “PaSswoRD2.”
SBTPassword, On,’PaSswoRD2’
```

**Description**
- You cannot use this command to configure settings when logged in as a user (when the user level is **User**).

---

### SWebCustomMenu

**Web Monitor Screen**

Shows or hides the categories displayed in the contents tree.

**Syntax**
```
SWebCustomMenu, p1, p2, p3, p4, p5
```
- **p1** User level (User, Monitor)
- **p2** Status display category
  - Show: On, hide: Off
- **p3** Log category
  - Show/hide (On, Off)
- **p4** System/Network information category
  - Show/hide (On, Off)
- **p5** File category
  - Show/hide (On, Off)

**Query**
```
SWebCustomMenu?
```

**Example**
```
Show the log category and file category for the user level.
SWebCustomMenu, User, Off, On, Off, On
```

**Description**
- This command can be used only when the user level is admin.
- When the advanced security function (/AS) is enabled, p1 is fixed to Monitor.

---

### SSessionSecurity

**Web Session Security Function (/AS) [GM]**

Sets the web session security function.

**Syntax**
```
SSessionSecurity, p1
```
- **p1** Session security (On, Off)

**Query**
```
SSessionSecurity?
```

**Example**
```
Use the session security function.
SSessionSecurity, On
```

**Description**
- This command can be executed only when the user is logged in as an administrator.
**SMonitor**

**Monitor Screen Display Information [GX/GP]**

Sets the monitor screen display information.

**Syntax**  
SMonitor, p1, p2  
  
p1  Information type (see the table below)  
p2  Status (see the table below)

<table>
<thead>
<tr>
<th>Information Type</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital</td>
<td>Digital value display Off, On</td>
</tr>
<tr>
<td>Message</td>
<td>Message display Stream, List</td>
</tr>
<tr>
<td>Trend</td>
<td>All channel/group display Group, All</td>
</tr>
<tr>
<td>Grid</td>
<td>Auxiliary grid Off, On</td>
</tr>
<tr>
<td>Axis</td>
<td>Time axis on historical trend 1, 2, 3, 4, 5, 6, 7, 8</td>
</tr>
<tr>
<td>Value</td>
<td>Digital value display on historical trend 4Value, Max, Min</td>

<td>ControlGroup</td>
<td>Control group Controller, Faceplate</td>
</tr>
<tr>
<td>ControlAlarm_Sort</td>
<td>Control alarm sort item Time, Loop, Level, Type</td>
</tr>
<tr>
<td>ControlAlarm_Order</td>
<td>Control alarm sort order Ascending, Descending</td>
</tr>
<tr>
<td>ControlAlarm_Time</td>
<td>Control alarm summary millisecond display Off, On</td>
</tr>
</tbody>
</table>

**Example** Set the trend display to all-channel display.  
SMonitor, Trend, All

**Description**
- Custom_No is an option (/CG).
- Modbus_M and Modbus_C are an option (/MC).
- Watt is an option (/E2).
- When p1 = Switch, p2 = 3 or 4 is valid only for the GX10/GP10.

**SMultiPattern**

**Multi Panel Division [GX/GP]**

Sets the multi panel multi panel pattern.

**Syntax**  
SMultiPattern, p1, p2, p3  
  
p1  Registration number (1 to 20)  
p2  Multi panel pattern  
p3  Multi panel name (up to 16 characters, UTF-8)

<table>
<thead>
<tr>
<th>Multi panel pattern</th>
<th>Multi panel name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wide2</td>
<td>Split 2 Wide</td>
</tr>
<tr>
<td>Tall2</td>
<td>Split 2 Tall</td>
</tr>
<tr>
<td>Wide3</td>
<td>Split 3 Wide</td>
</tr>
<tr>
<td>Tall3</td>
<td>Split 3 Tall</td>
</tr>
<tr>
<td>Split4</td>
<td>Split 4 Even</td>
</tr>
<tr>
<td>Even5</td>
<td>Split 5 Even</td>
</tr>
<tr>
<td>Odd5</td>
<td>Split 5 Odd</td>
</tr>
<tr>
<td>Even6</td>
<td>Split 6 Even</td>
</tr>
<tr>
<td>Odd6</td>
<td>Split 6 Odd</td>
</tr>
</tbody>
</table>

**Query** SMultiPattern[,p1]?

**Example** Set the panel of registration number 1 to “Split 2 Wide.” Set the multi panel name to “Monitor1.”  
SMultiPattern, 1, Wide2,'Monitor1'

**Description**
- This command is only valid for the GX20/GP20.
- This command can be used only when the multi batch function (/BT) is disabled.
### SMultiKind

**Multi Panel [GX/GP]**

Set the screens to display on the multi panel.

**Syntax**

```
SMultiKind,p1,p2,p3,p4
```

- **p1**: Registration number (1 to 20)
- **p2**: Screen position (1 to 6)
- **p3**: Screen type
  - Trend
  - Digital
  - Bar
  - Overview
  - Alarm
  - Message
  - Memory
  - Report
  - Modbus-M
  - Modbus-C
  - Watt
  - Switch
  - Action-Log
  - Error-Log
  - Commu-Log
  - Ftp-Log
  - Web-Log
  - Mail-Log
  - Modbus-M
  - Modbus-C
  - Watt
  - Switch
  - Action-Log
  - Error-Log
  - Commu-Log
  - Ftp-Log
  - Web-Log
  - Mail-Log
  - Modbus-M
  - Modbus-C
  - Watt
  - Switch
  - Action-Log
  - Error-Log
  - Commu-Log
  - Ftp-Log
  - Web-Log
  - Mail-Log
  - Modbus-M
  - Modbus-C
  - Watt
  - Switch

- **p4**: Group number
  - If p3=Trend, Digital, or Bar
  - Display group number
  - If p3=ControlGroup
  - Control group number

**Query**

```
SMultiKind[,p1[,p2]]?
```

**Example**

Display the bar graph of display group 8 in screen position 3 of the registration number 1 panel.

```
SMultiKind,1,3,Bar,8
```

**Description**

- This command is only valid for the GX20/GP20.
- Report is an option (/MT).
- Modbus-M and Modbus-C are an option (/MC).
- Watt is an option (/E2).
- Custom display screen (/CG) cannot be shown in a multi panel.
- This command can be used only when the multi batch function (/BT) is disabled.
- ControlGroup, ControlSummary, ControlAlarmSummary, and ControlOverview are valid when the PID control module is installed.

---

### SHomeMonitor

**Standard Screen Information [GX/GP]**

Sets the standard screen display information.

**Syntax**

```
SHomeMonitor,p1,p2
```

- **p1**: Information type (see the table of the SMonitor command)
- **p2**: Status (see the table of the SMonitor command)

**Query**

```
SHomeMonitor[,p1]?
```

**Example**

Set the trend display to all-channel display.

```
SHomeMonitor,Trend,All
```

---

### SHomeKind

**Standard Screen [GX/GP]**

Set the standard screen.

**For Multi Panel**

**Syntax**

```
SHomeKind,p1,p2,p3
```

- **p1**: Screen type (Multi)
- **p2**: Multi panel number (1 to 20)
- **p3**: Batch group number (1 to the number used)

**Query**

```
SMultiKind[,p1[,p2]]?
```

**Example**

Display the bar graph of display group 8 in screen position 3 of the registration number 1 panel.

```
SMultiKind,1,3,Bar,8
```

---

**Description**

- This command is only valid for the GX20/GP20.
- Report is an option (/MT).
- Modbus-M and Modbus-C are an option (/MC).
- Watt is an option (/E2).
- Custom display screen (/CG) cannot be shown in a multi panel.
- This command can be used only when the multi batch function (/BT) is disabled.
- ControlGroup, ControlSummary, ControlAlarmSummary, and ControlOverview are valid when the PID control module is installed.
### 2.4 Setting Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modbus-Log</td>
<td>Modbus log</td>
</tr>
<tr>
<td>Snntp-Log</td>
<td>SNTP log</td>

<tr>
<td>Custom</td>
<td>Customized display screen</td>
</tr>
<tr>
<td>Display</td>
<td>Batch overview (/BT)</td>
</tr>
<tr>
<td>Batch</td>
<td>Tuning</td>
</tr>
<tr>
<td>Overview</td>
<td>Program selection (/PG)</td>
</tr>
<tr>
<td>Tuning</td>
<td>Program operation (/PG)</td>
</tr>
<tr>
<td>ProgramSelect</td>
<td>Program Select (/PG)</td>
</tr>
<tr>
<td>ProgramRun</td>
<td>Program Run (/PG)</td>
</tr>
</tbody>
</table>

#### ControlGroup, ControlSummary, ControlAlarmSummary, ControlOverview, and Tuning
- Valid when the PID control module is installed.
- ProgramSelect and ProgramRun are options (/PG).

### SFavoriteMonitor

**Favorite Screen Display Information [GX/GP]**

Sets the favorite screen display information.

**Syntax**

```
SFavoriteMonitor,p1,p2,p3
```

- **p1**: Favorites number (1 to 20)
- **p2**: Information type (see the table of the `SMonitor` command)
- **p3**: Status (see the table of the `SMonitor` command)

**Query**

```
SFavoriteMonitor[,p1[,p2]]?
```

**Example**

Set the trend display to all-channel display.  
```
SFavoriteMonitor,1,Trend,All
```

### SFavoriteKind

**Favorite Screen [GX/GP]**

Set the favorite screen.

**For Multi Panel**

**Syntax**

```
SFavoriteKind,p1,p2,p3,p4,p5,p6
```

- **p1**: Favorites number (1 to 20)
- **p2**: Enable or disable (Off, On)
- **p3**: Screen type (Multi)
- **p4**: Multi panel number (1 to 20)
- **p5**: Panel name (up to 16 characters, UTF-8)
- **p6**: Batch group number (1 to the number used)

- **p6** is valid when the multi batch function (/BT) is enabled.

**Query**

```
SFavoriteKind[,p1]
```

**Example**

Set the standard screen to trend of display group 1.  
```
SFavoriteKind,Trend,1
```

**Description**

- Report is an option (/MT).
- Modbus-M and Modbus-C are an option (/IMC).
- Watt is an option (/E2).
- CustomDisplay is an option (/CG).
- Multi is a GX20/GP20 display.
- p3 is valid when the multi batch function (/BT) is enabled.
- When the multi batch function (/BT) is not available, p3 is fixed to 1.
- p1 cannot be set to BatchOverview when p3 is 1 to 12.
- p1 cannot be set to Trend, Digital, Bar, Alarm, Message, Memory, or Multi when p3 = All.
- p3 cannot be set to All when p1 is set to Trend, Digital, Bar, Alarm, Message, Memory, or Multi.
- p3 cannot be set to 1 to 12 when p1 is set to BatchOverview.

**For Screens other than Multi Panel**

**Syntax**

```
SFavoriteKind,p1,p2,p3,p4,p5,p6
```

- **p1**: Favorites number (1 to 20)
- **p2**: Enable or disable (Off, On)
- **p3**: Screen type (see p1 of the `SHomeKind` command)
- **p4**: Display group number (when p3 is not CustomDisplay)  
  Customized display screen number (1 to 30)  
  Control group number (1 to 10)  
  Control group number (1 to 10)  
  Program pattern number (1 to 99)  
  Program pattern number (1 to 99)  
- **p5**: Favorite screen name (up to 16 characters, UTF-8)
- **p6**: Multi batch number (All, 1 to the number used)

**Query**

```
SFavoriteKind[,p1]
```

**Example**

Set the trend display to all-channel display.  
```
SFavoriteKind,1,Trend,All
```
Example
Register the trend display of display group 2 to favorites screen number 1. Set the screen name to “Favorite01.”
SFavoriteKind,1,On,Trend,2,’Favorite01’

SMltTextField

Batch Text
Sets the batch text field for multi batch.
Syntax
SMltTextField,p1,p2,p3,p4
p1 Batch group number (1 to the number used)
p2 Field number (1 to 24)
p3 Title (up to 20 characters, UTF-8)
p4 Character string (up to 30 characters, UTF-8)

Query
SMltTextField[,p1[,p2]]?

Example
For field number 3 of batch group 2, set the field title to “OPERATOR” and the character string to “RECODER1.”
SMltTextField,2,3,’OPERATOR’,’RECODER1’

Description
• This command cannot be used if the batch setting is disabled (SBatch: p1=Off).
• This command is the same as STextField when p1=1.

SMltFileHead

File Header
Sets the file header for multi batch.
Syntax
SMltFileHead,p1,p2
p1 Batch group number (1 to the number used)
p2 File header (up to 50 characters, UTF-8)

Query
SMltFileHead[,p1]?

Example
Set the file header to “GX_DATA.”
SMltFileHead, 1, ‘GX_DATA’

Description
• This command is the same as SFileHead when p1=1.

SMltFileName

File Naming Rule
Sets the file naming rule for saving multi batch data.
Syntax
SMltFileName,p1,p2,p3
p1 Batch group number (1 to the number used)
p2 File naming rule
Date Date
Serial Serial number
Batch Batch name
p3 Specified file name (up to 16 characters, ASCII)

Query
SMltFileName[,p1]?

Example
Set the file naming rule of batch group 2 to “Date.”
Set the specified file name to “Recorder1_data.”
SMltFileName,2,Date,’Recorder1_data’

Description
• This command is the same as SFileName when p1=1.
• If the batch setting is disabled (SBatch: p1=Off), p2 cannot be set to Batch.

SMltGroup

Display Group
Sets the display group for multi batch.
Syntax
SMltGroup,p1,p2,p3,p4,p5
p1 Batch group number (1 to the number used)
p2 Display group number
p3 Enable or disable (Off, On)
p4 Group name (up to 16 characters, UTF-8)
p5 Channel character string
• Specify using channel numbers. 4-digit numbers for I/O channels. Numbers that start with “A” for math channels (A015). Numbers that start with “C” for communication channels (C020). The maximum number of characters per channel is 4.
• Use periods to separate channel numbers (see example).

Query
SMltGroup[,p1[,p2]]?

Example
Assign channels 0001, 0003, 0005, A001, and C023 to display group 1 of batch group 3 and name it “GROUP A.”
SMltGroup,3,1,On,’GROUP A’1.3.5.A1. C23’

Description
• This command is the same as SGroup when p1=1.
SMltTripLine

Display Group Trip Line
Sets the display group trip line for multi batch.

Syntax

SMltTripLine,p1,p2,p3,p4,p5,p6,p7,p8,p9

p1 Batch group number (1 to the number used)
p2 Display group number
p3 Trip line number (1 to 4)
p4 Enable or disable (Off, On)
p5 Display position [%] (1 to 100)
p6 R value of RGB display colors (0 to 255)
p7 G value of RGB display colors (0 to 255)
p8 B value of RGB display colors (0 to 255)
p9 Line width
  (GX/GP: Thin, Normal, Thick)
  (GM: Normal)
  Thin Thin
  Normal Normal
  Thick Thick

Query

SMltTripLine[,]p1[,]p2[,]p3]]?

Example

Display trip line 1 using a thick line in red at the 80% position of display group 2 of batch group 3.

SMltTripLine,3,2,1,80,255,0,0,Thick

SMltSclBmp [GX/GP]

Scale Bitmap
Sets the display group’s scale bitmap file for multi batch.

Syntax

SMltSclBmp,p1,p2,p3

p1 Batch group number (1 to the number used)
p2 Display group number
p3 Enable or disable (Off, On)

Query

SMltSclBmp[,]p1[,]p2]??

Example

Use a bitmap scale image on display group 3 of batch group 2.

SMltSclBmp,2,3,On

SMltMultiPattern

Multi Panel Pattern
Sets the multi panel pattern for multi batch.

Syntax

SMltMultiPattern,p1,p2,p3,p4

p1 Batch group number (1 to the number used)
p2 Registration number (1 to 20)
p3 Division pattern
  Wide2 Split 2 Wide
  Tall2 Split 2 Tall
  Wide3 Split 3 Wide
  Tall3 Split 3 Tall
  Split4 Split 4 Even
  Even5 Split 5 Even
  Odd5 Split 5 Odd
  Even6 Split 6 Even
  Odd6 Split 6 Odd

Query

SMltMultiPattern[,]p1[,]p2]??

Example

Set batch group 2. Set the panel of registration number 1 to “Split 2 Wide.” Set the panel name to “Monitor1.”

SMltMultiPattern,2,1,Wide2’Monitor1’

Description

• This command is valid for the GX20/GP20.
• This command is valid when the multi batch function (/BT) is enabled.

SMltMultiKind

Multi Panel Type
Sets the multi panel pattern for multi batch.

Syntax

SMltMultiKind,p1,p2,p3,p4,p5

p1 Batch group number (1 to the number used)
p2 Registration number (1 to 20)
p3 Screen position (1 to 6)
p4 Screen type (see p1 of the SMultiKind command)
p5 Display group number

Query

SMltMultiKind[,]p1[,]p2[,]p3]??

Example

Set the panel of registration number 1 to “Split 2 Wide.” Set the panel name to “Monitor1.”

SMultiPattern,1,Wide2,’Monitor1’

Description

• This command is valid for the GX20/GP20.
• This command is valid when the multi batch function (/BT) is enabled.
### 2.4 Setting Commands

#### SBluetooth

**Bluetooth Communication Function (/C8) [GM]**
Sets the Bluetooth communication function.

**Syntax**
```
SBluetooth,p1
```
- **p1** Bluetooth function On/Off (On, Off)
  - **On** Use
  - **Off** Not Use

**Query**
```
SBluetooth?
```
**Example**
Use the Bluetooth communication function.
```
SBluetooth,On
```

**Description**
- The settings specified with this command take effect with the `OBTApply` command. The settings do not change until you send the `OBTApply` command.

---

#### SBTID

**Bluetooth Communication ID (/C8) [GM]**
Sets the Bluetooth communication ID.

**Syntax**
```
SBTID,p1
```
- **p1** Local device name (GM’s Bluetooth device name)
  - Up to 30 characters, ASCII

**Query**
```
SBTID?
```
**Example**
Set the local device name to “SMARTDAC+ GM.”
```
SBTID,'SMARTDAC+ GM'
```

---

#### SBTTimeout

**Bluetooth Communication Timeout (/C8) [GM]**
Sets the Bluetooth communication timeout.

**Syntax**
```
SBTTimeout,p1
```
- **p1** Timeout function (Off, 1min, 2min, 5min, 10min)

**Query**
```
SBTTimeout?
```
**Example**
Set the Bluetooth communication timeout value to 5 minutes.
```
SBTTimeout,5min
```

**Description**
- If the login function is in use, users that are logged in are automatically logged out when a timeout occurs.

---

#### SUSbFunction

**USB Communication Function [GM]**
Configures USB communication function settings.

**Syntax**
```
SUsbFunction,p1
```
- **p1** USB communication function On/Off (On, Off)
  - **On** Use
  - **Off** Not Use

**Query**
```
SUsbFunction?
```

**Example**
Use the USB communication function.
```
SUsbFunction,On
```

**Description**
- The settings specified with this command take effect with the `OUsbFApply` command. The settings do not change until you send the `OUsbFApply` command.

---

#### SUSbAutoLOut

**USB Communication Auto Logout [GM]**
Sets the auto logout for USB communication.

**Syntax**
```
SUsbAutoLOut,p1
```
- **p1** Auto logout function (Off, 1 min, 2 min, 5 min, 10 min)

**Query**
```
SUsbAutoLOut?
```
**Example**
Set the USB communication’s auto logout time to 2 minutes.
```
SUsbAutoLOut,2min
```

**Description**
- Users logged in via USB communication can be automatically logged out.

---

#### SWebCustomMenu

**Web Monitor Screen**
Sets the contents displayed on the monitor screens.

**Syntax**
```
SWebCustomMenu,p1,p2,p3,p4,p5
```
- **p1** User level (User, Monitor)
- **p2** Status display category (On, Off)
- **p3** Log category (On, Off)
- **p4** System category (On, Off)
- **p5** File category (On, Off)

**Query**
```
SWebCustomMenu?
```
**Example**
Display the log category and file category contents on the monitor screen when a user whose user level is User accessed.
```
SWebCustomMenu,User,Off,On,Off,On
```

**Description**
- This command can be executed only when the user is logged in as an administrator.
- p1=Monitor is valid when the advanced security function (/AS) is enabled.

---

#### SSchedule

**Schedule Management**
Configures the schedule management function.

**Syntax**
```
SSchedule,p1,p2,p3,p4,p5,p6,p7,p8,p9
```
- **p1** Schedule number
- **p2** Schedule management function On/Off
  - **On** Use
  - **Off** Not Use
- **p3** Date Year (2001 to 2035)
- **p4** Date Month (1 to 12)
- **p5** Date Day (1 to 31)
**p6** Notification date
1day 1 day before
2day 2 days before
3day 3 days before
4day 4 days before
5day 5 days before
6day 6 days before
7day 7 days before
8day 8 days before
9day 9 days before
10day 10 days before

**p7** Renotification interval (10min, 30min, 1h, 8h, 24h)

**p8** Notification buzzer (On, Off)

**p9** Calibration correction settings
(GX/GP: Off, On)
(GM: Off)

On The calibration correction settings is shown in the date setting screen.

Off The calibration correction settings is not shown in the date setting screen.

---

**Query**

SSchedule[,p1]?

**Example**

Set schedule number 1 with the date set to December 24, 2015, the notification set to 5 days before, and the renotification interval to 1 hour. Enable the notification buzzer. Show the calibration correction settings in the date setting screen.

SSchedule,1,On,2015,12,24,5day,1h,On,On

**Description**

- This command can be used on a product with the aerospace heat treatment (/AH) option.
- Operation lock ChangeSet and user privileges CalibSet limitations apply to this command.

---

**SDualGroup**

**Scan group number of the display group**

If the measurement mode is set to dual interval, set the scan group of the display group.

**Syntax**

SDualGroup,p1,p2

- p1 Group number
- p2 Scan group number (1 or 2)

**Query**

SDualGroup[,p1]?

**Example**

Set master scan interval to scan group 2.

SDualGroup,5,2

**Description**

- You can set this command when the dual interval function is enabled.

---

**SMasterScanGrp**

**Master Scan Interval**

Sets the master scan interval when the measurement mode is set to dual interval.

**Syntax**

SMasterScanGrp,p1

- p1 Scan group number (1 or 2)

**Query**

SMasterScanGrp?

**Example**

Set display group 5 to scan group 2.

SMasterScanGrp,2

**Description**

- You can set this command when the dual interval function is enabled.

---

**SCtrlMode**

**Control Mode**

Sets the control mode.

**Syntax**

SCtrlMode,p1,p2,p3,p4

- p1 Unit number
- p2 Module number
- p3 Mode (Single, Cascade, PVSwitching)
  - Single Single loop control
  - Cascade Cascade control
  - PVSwitching PV switching
- p4 PV switching condition (when p3 is PVSwitching)
  - LowRange Switch within range (Low side)
  - HighRange Switch within range (High side)
  - PVHigh Switch at PV high limit
  - Signal Switch using DI

**Query**

SCtrlMode[,p1,p2]?

**Example**

Set the control mode of the PID module with module number 2, connected to the main unit, to PV switching and the switching condition to switch using DI.
### SCtrlMode, 2-74, PVSwitching, Signal

**Description**
- This command is valid when a PID Control Module is installed.

### SCtrlScan

**Control Period**
Sets the control period.

**Syntax**
```
SCtrlScan,p1,p2,p3
```
- `p1` Unit number
  - Fixed to “–”.
- `p2` Module number
  - Fixed to “–”.
- `p3` Control period (100ms, 200ms)

**Query**
```
SCtrlScan?
```

**Example**
- Set the control period to 100ms.
  
  SCtrlScan,-,-,100ms

**Description**
- This command is valid when a PID Control Module is installed.

### SCtrlAction

**Control**
Sets the control.

**Syntax**
```
SCtrlAction,p1,p2,p3
```
- `p1` Unit number
- `p2` Module number
- `p3` Power recovery action
  - RESTART_CONT Continue
  - RESTART_MAN Manual
  - RESTART_AUTO Auto
  - RESTART_RESET Reset

**Query**
```
SCtrlAction[,,p1,p2]
```

**Example**
- Set the power recovery action of module number 2 connected to the main unit to manual.
  
  SCtrlAction,0,2,RESTART_MAN

**Description**
- This command is valid when a PID Control Module is installed.
- You can set `p3` to RESTART_RESET when the program control function (/PG option) is enabled.

### SCtrlType

**Control Type**
Sets the control type.

**Syntax**
```
SCtrlType,p1,p2
```
- `p1` Loop number
- `p2` Control Type
  - PID
  - ONOFF

**Query**
```
SCtrlType[,p1]
```

**Example**
- Set the control type of loop number L022 to ON/OFF control.
  
  SCtrlType,022,ONOFF

**Description**
- This command is valid when a PID Control Module is installed.
• The RSP function of the secondary side cannot be set to On (p5=On) in cascade mode.
• The available options for p3 (PID selection) varies depending on whether the program control function (/PG option) is available.

### SCtrlSPPID

**Number of SP Groups, Number of PID Groups**

Sets the number of SP groups, number of PID groups

**Syntax**

```
SCtrlSPPID, p1, p2, p3
```

- **p1** Loop number
- **p2** SP group number (1 to 8)
- **p3** PID group number (1 to 8)

**Query**

```
SCtrlSPPID[, p1]
```

**Example**

For loop number L022, set the number of SP groups to 6 and the number of PID groups to 3.

```
SCtrlSPPID, L022, 6, 3
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlALNo

**Number of Control Alarms**

Sets the number of control alarms

**Syntax**

```
SCtrlALNo, p1, p2
```

- **p1** Loop number
- **p2** Number of control alarms (1 to 4)

**Query**

```
SCtrlALNo[, p1]
```

**Example**

For loop number L022, set the number of control alarms to 3.

```
SCtrlALNo, L022, 3
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlAlmMode

**Alarm Mode**

Sets the alarm mode.

**Syntax**

```
SCtrlAlmMode, p1, p2
```

- **p1** Loop number
- **p2** Alarm mode
  - ALM_MODE_ALWAYS: Always active
  - ALM_MODE_STOP: Not active in STOP mode
  - ALM_MODE_STOP_MAN: Not active in STOP or MAN mode

**Query**

```
SCtrlAlmMode[, p1]
```

**Example**

For loop number L022, set the alarm mode to always active.

```
SCtrlAlmMode, L022, ALM_MODE_ALWAYS
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlDIRegist

**Contact Registration**

Registers a contact

**Syntax**

```
SCtrlDIRegist, p1, p2, p3, p4
```

- **p1** Unit number
- **p2** Module number
- **p3** Action
  - A-M_LP1: AUTO/MAN Switch (A/M) LP1
  - A-M_LP2: AUTO/MAN Switch (A/M) LP2
  - R-L_LP1: REMOTE/LOCAL Switch (R/L) LP1
  - R-L_LP2: REMOTE/LOCAL Switch (R/L) LP2
  - S-R_LP1: STOP/RUN Switch (S/R) LP1
  - S-R_LP2: STOP/RUN Switch (S/R) LP2
  - CAS: Switch to Cascade (CAS)
  - AUTO_LP1: Switch to AUTO (AUTO) LP1
  - AUTO_LP2: Switch to AUTO (AUTO) LP2
  - MAN_LP1: Switch to MAN (MAN) LP1
  - MAN_LP2: Switch to MAN (MAN) LP2
  - REM_LP1: Switch to REMOTE (REM) LP1
  - REM_LP2: Switch to REMOTE (REM) LP2
  - LCL_LP1: Switch to LOCAL (LCL) LP1
  - LCL_LP2: Switch to LOCAL (LCL) LP2
  - AT_LP1: Auto-tuning START/STOP Switch (AT) LP1
  - AT_LP2: Auto-tuning START/STOP Switch (AT) LP2
  - SW: PV switching (SW)
  - ACK_LP1: Alarm ACK (ACK) LP1
  - ACK_LP2: Alarm ACK (ACK) LP2
  - SPBit0_LP1: Bit-0 of SP Number LP1
  - SPBit1_LP1: Bit-1 of SP Number LP1
  - SPBit2_LP1: Bit-2 of SP Number LP1
  - SPBit3_LP1: Bit-3 of SP Number LP1
  - PIDBit0_LP1: Bit-0 of PID Number LP1
  - PIDBit1_LP1: Bit-1 of PID Number LP1
  - PIDBit2_LP1: Bit-2 of PID Number LP1
  - PIDBit3_LP1: Bit-3 of PID Number LP1
- **p4** Terminal number

**Query**

```
SCtrlDIRegist[, p1]
```

**Example**

For loop number L022, contact registration to DI1, DO1, ALM1_L1.

```
SCtrlDIRegist, L022, DI1, DO1, ALM1_L1
```

**Description**

- No registration
- Contact input
- Contact output
- Alarm status loop 1
- Alarm output loop 1
- Alarm status loop 2
- Alarm output loop 2
### 2.4 Setting Commands

**Query**  
`SCtrlDIReregist[,p1,p2,p3]`?

**Example**  
Set the AUTO/MAN Switch (A/M) LP1 of module number 2 connected to the main unit to DI1.  
`SCtrlDIReregist,0,2,A-M_LP1,DI1`

**Description**
- This command is valid when a PID Control Module is installed.
- ALM\_\*Lx(*=1 to 4, x=1 or 2) indicates the alarm status. ALM\_*OUT_Lx(*=1 to 4, x=1 or 2) indicates the alarm output status including the relay action.
- The valid range of p4 options varies depending on the p3 (action) setting. For details, see the table below ("Validity of p3 settings and p4 terminal numbers").

#### Validity of p3 settings and p4 terminal numbers

<table>
<thead>
<tr>
<th>p3 action</th>
<th>p4 options</th>
<th>Conditions in which p3 is valid when p4 is not Off</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch to MAN (MAN) LP2</td>
<td>MAN_LP2 x — x</td>
<td>Valid when the control mode is not PV switching</td>
</tr>
<tr>
<td>Switch to REMOTE (REM) LP1</td>
<td>REM_LP1 x x</td>
<td>Valid when the RSP function is on (see odd loops)</td>
</tr>
<tr>
<td>Switch to REMOTE (REM) LP2</td>
<td>REM_LP2 x x</td>
<td>Valid when the RSP function is on (see even loops)</td>
</tr>
</tbody>
</table>

#### p3 options

<table>
<thead>
<tr>
<th>Description</th>
<th>Option</th>
<th>Off DI1 to DO8</th>
<th>ALM_L1 to ALM_L1</th>
<th>ALM_L2 to ALM_L2</th>
<th>Conditions in which p3 is valid when p4 is not Off</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO/MAN Switch (A/M) LP1</td>
<td>A-M_LP1</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the control mode is not cascade</td>
</tr>
<tr>
<td>AUTO/MAN Switch (A/M) LP2</td>
<td>A-M_LP2</td>
<td>x</td>
<td>—</td>
<td>—</td>
<td>Valid when the control mode is not PV switching</td>
</tr>
<tr>
<td>REMOTE/LOCAL Switch (R/L) LP1</td>
<td>R-L_LP1</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the RSP function is on (see odd loops)</td>
</tr>
<tr>
<td>REMOTE/LOCAL Switch (R/L) LP2</td>
<td>R-L_LP2</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the RSP function is on (see even loops)</td>
</tr>
<tr>
<td>STOP/RUN Switch (S/R) LP1</td>
<td>S-R_LP1</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Always valid</td>
</tr>
<tr>
<td>STOP/RUN Switch (S/R) LP2</td>
<td>S-R_LP2</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Always valid</td>
</tr>
<tr>
<td>Switch to Cascade (CAS)</td>
<td>CAS</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the control mode is not cascade</td>
</tr>
<tr>
<td>Switch to AUTO (AUTO) LP1</td>
<td>AUTO_LP1</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the control mode is not cascade</td>
</tr>
<tr>
<td>Switch to AUTO (AUTO) LP2</td>
<td>AUTO_LP2</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the control mode is not PV switching</td>
</tr>
<tr>
<td>Switch to MAN (MAN) LP1</td>
<td>MAN_LP1</td>
<td>x x</td>
<td>—</td>
<td>—</td>
<td>Valid when the control mode is not cascade</td>
</tr>
</tbody>
</table>

### Example

Set the AUTO/MAN Switch (A/M) LP1 of module number 2 connected to the main unit to DI1.

```
SCtrlDIReregist,0,2,A-M_LP1,DI1
```
### 2.4 Setting Commands

#### Commands and Responses

<table>
<thead>
<tr>
<th>p3 action</th>
<th>Condition in which p3 is valid when p4 is not Off</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>App</strong></td>
<td><strong>Option</strong> Off <strong>D18 to D01 to D08</strong> <strong>ALM1</strong> L1 to <strong>ALM4</strong> L1 <strong>ALO1</strong> L1 to <strong>ALO4</strong> L1 <strong>ALM1</strong> L2 to <strong>ALM4</strong> L2 <strong>ALO1</strong> L2 to <strong>ALO4</strong> L2</td>
</tr>
</tbody>
</table>

- **Bit-3 of SP Number** LP1
  - SPBit3_ LP1
  - Description: Always valid

- **Bit-0 of SP Number** LP2
  - SPBit0_ LP2
  - Description: Valid when the control mode is not PV switching

- **Bit-1 of SP Number** LP2
  - SPBit1_ LP2
  - Description: Valid when the control mode is not PV switching

- **Bit-2 of SP Number** LP2
  - SPBit2_ LP2
  - Description: Valid when the control mode is not PV switching

- **Bit-3 of SP Number** LP2
  - SPBit3_ LP2
  - Description: Valid when the control mode is not PV switching

- **Bit-0 of PID Number** LP1
  - PIDBit0_ LP1
  - Description: Valid when the PID selection is external selection (see odd loop settings)

- **Bit-1 of PID Number** LP1
  - PIDBit1_ LP1
  - Description: Valid when the PID selection is external selection (see odd loop settings)

- **Bit-2 of PID Number** LP1
  - PIDBit2_ LP1
  - Description: Valid when the PID selection is external selection (see odd loop settings)

- **Bit-3 of PID Number** LP1
  - PIDBit3_ LP1
  - Description: Valid when the PID selection is external selection (see odd loop settings)

  - PIDBit0_ LP2
  - Description: Valid when the PID selection is external selection (see even loop settings)

- **Bit-1 of PID Number** LP2
  - PIDBit1_ LP2
  - Description: Valid when the PID selection is external selection (see even loop settings)
2.4 Setting Commands

**SCtrlRelay**

**DO Terminal Action (Relay Action)**

Sets the DO terminal action (relay action) of a PID module.

When the output is “contact output within module”

**Syntax**

```
SCtrlRelay, p1, p2, p3, p4, p5, p6, p7
```

- **p1** Unit number
- **p2** Module number
- **p3** DO number (DO1 to DO8)
- **p4** Output type
  - CtrlRelay: Contact output within module
- **p5** Loop selection
  - LP1: Loop 1
  - LP2: Loop 2
  - COMM: Common to loop 1 and loop 2
- **p6** Status (see the table below)
  - The valid range of p6 (status) varies depending on the p5 (loop) options.
  - p7: Energize/De-energize (Energize, De-Energize)
  - Energize: Energize
  - De-Energize: De-energize

<table>
<thead>
<tr>
<th>p6 (status)</th>
<th>Content</th>
<th>p5 (loop)</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>OFF</td>
<td>LP1, LP2, COMM</td>
</tr>
<tr>
<td>ALM1_OUT_L1</td>
<td>Alarm 1 status loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>ALM2_OUT_L1</td>
<td>Alarm 2 status loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>ALM3_OUT_L1</td>
<td>Alarm 3 status loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>ALM4_OUT_L1</td>
<td>Alarm 4 status loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>ALM1_L1</td>
<td>Alarm 1 loop 1</td>
<td>LP1</td>
</tr>
<tr>

</tr>
<tr>
<td>SR_L1</td>
<td>STOP/RUN loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>AM_L1</td>
<td>AUTO/MAN loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>RL_L1</td>
<td>REMOTE/LOCAL loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>AT_L1</td>
<td>Auto-tuning status loop 1</td>
<td>LP1</td>
</tr>
<tr>
<td>EXPV_ANAPVL1</td>
<td>EXPV/LOCAL loop 1</td>
<td>LP1</td>
</tr>
</tbody>
</table>

When the output is “Alarm” and the action is “And/Or”

**Syntax**

```
SCtrlRelay, p1, p2, p3, p4, p5, p6, p7, p8
```

- **p1** Unit number
- **p2** Module number
- **p3** DO number (DO1 to DO8)
- **p4** Output type
  - Alarm
- **p5** Energize/De-energize (Energize, De-Energize)
  - Energize: Energize
  - De-Energize: De-energize
- **p6** Action (And, Or)
  - And: Operate when all set alarms are in the alarm state.
  - Or: Operate when any of the set alarms are in the alarm state.
- **p7** State
  - Hold: Hold
  - Nonhold: Nonhold
- **p8** Relay Action on ACK (Normal, Reset)

When the output is “Manual”

**Syntax**

```
SCtrlRelay, p1, p2, p3, p4, p5
```

- **p1** Unit number
- **p2** Module number
- **p3** DO number (DO1 to DO8)
- **p4** Output type
  - Manual
- **p5** Energize or de-energize
  - Energize: Energize
  - De-Energize: De-energize

**Query**

```
SCtrlRelay[], p1, p2, p3
```
Example

Set DO1 of module number 2 connected to the main unit to manual and energize.

SCtrlRelay, 0, 2, DO1, Manual, Energize

Description

- This command is valid when a PID Control Module is installed.
- If p4=CtrlRelay, p6 alarm level is indicated as ALM*_LX(*=1 to 8, x=1 or 2), ALM*_OUT_LX(*=1 to 8, x=1 or 2) indicates the alarm output status including the relay action.

**SCtrlRangeAI**

**Measurement Input Range**

Sets the range of the AI terminal of a PID control module.

**Input type is TC or RTD**

**Syntax**

```
SCtrlRangeAI, p1, p2, p3, p4, p5, p6, p7, p8, p9
```

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Input type (TC, RTD)
- **p5** Range (see “Description.”)
- **p6** Math type (Off)
- **p7** Span low limit
- **p8** Span high limit
- **p9** Bias (−999999 to 999999)

**Input type is not TC or RTD and math type is Scaling**

**Syntax**

```
SCtrlRangeAI, p1, p2, p3, p4, p5, p6, p7, p8, p9, p10, p11, p12, p13
```

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Input type (Volt, GS, DI)
- **p5** Range (see “Description.”)
- **p6** Math type (Scale)
- **p7** Span low limit
- **p8** Span high limit
- **p9** Bias (−999999 to 999999)
- **p10** Decimal Place (0 to 5)
- **p11** Scaling low limit
- **p12** Scaling high limit
- **p13** Unit (up to 6 characters, UTF-8)

**Input type is GS or Volt and math type is square root**

**Syntax**

```
SCtrlRangeAI, p1, p2, p3, p4, p5, p6, p7, p8, p9, p10, p11, p12, p13, p14, p15, p16
```

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Input type (Volt, GS)
- **p5** Range (see “Description.”)
- **p6** Math type (Sqrt)
- **p7** Span low limit
- **p8** Span high limit

**Query**

SCtrlRangeAI, [p1, p2, p3]?

**Example**

Measure -0.5000 to 1.0000 V on channel 0002.

No scaling. No bias.

```
SCtrlRangeAI, 0002, Volt, 2V, Off, -5000, 10000, 0
```

**Description**

- This command is valid when a PID Control Module is installed.
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p4=TC/RTD, p6 is set to Off.
- If p4=TC/RTD/DI, p6 cannot be set to Sqrt.
- If p4=Volt/GS/DI, p6 cannot be set to Off.
- If p4=DI, you cannot set p9 (bias).
- The settable items for p5 are shown in the table below.

<table>
<thead>
<tr>

</table>

- For the setting ranges of p7 (span low limit) and p8 (span high limit), see the PID Control User’s Manual (IM 04L51B01-31EN).

**SCtrlBurnOut**

**Burnout Mode**

Sets the burnout action of the AI terminal of a PID module.

**Syntax**

```
SCtrlBurnOut, p1, p2, p3, p4
```

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Burnout action (Off, Up, Down)
### 2.4 Setting Commands

| Query     | SCtrlBurnOut[,p1,p2,p3]?
| Example   | When a burnout is detected on AI1 of module number 2 connected to the main unit, set the terminal to UP. SCBurnOut,0,2,AI1,Up

**Description**
- This command is valid when a PID Control Module is installed.
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.

### SCtrlRjc

**RJC temperature**
Sets the RJC temperature of the AI terminal of a PID control module.

**Syntax**
SCtrlRjc,p1,p2,p3,p4,p5

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Mode (Internal, External)
  - Internal
  - External
- **p5** Compensation temperature
  - Fahrenheit -40 to 1760
  - Celsius -200 to 800
  - Absolute -2531~3532

**Query**
SCtrlRjc[,p1,p2,p3]?

**Example**
Set the reference junction compensation of AI1 of module number 2 connected to the main unit to internal compensation circuit.

SCtrlRjc,0,2,AI1,Internal

Set the reference junction compensation of AI1 of module number 2 connected to the main unit to external reference junction compensation and the compensation temperature to -2.3.

SCtrlRjc,0,2,AI1,External,-2.3

**Description**
- This command is valid when a PID Control Module is installed.
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p4=Internal, you cannot set p5.
- Absolute temperature (K) is valid when the input type is TC and the range type is KpvsAu7Fe.

### SCtrlFilter

**First-Order Lag Filter**
Sets the first-order lag filter of the AI terminal of the PID control module.

**Syntax**
SCtrlFilter,p1,p2,p3,p4,p5

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (A11, A12)
- **p4** Mode (Internal, External)
  - Internal
  - External
- **p5** First-order lag constant (0 to 120) Unit: sec

**Query**
SCtrlFilter[,p1,p2,p3]?

**Example**
Set the first-order lag of AI1 of module number 2 connected to the main unit to 110 (s).

SCtrlFilter,0,2,AI1,On,110

**Description**
- This command is valid when a PID Control Module is installed.
- You cannot use this command to configure settings while recording is in progress.
- You cannot use this command to configure settings while computation is in progress.
- If p4=Internal, you cannot set p5.
- Absolute temperature (K) is valid when the input type is TC and the range type is KpvsAu7Fe.

### SCtrlCalibAI

**Calibration Correction**
Sets the calibration correction of the AI terminal of the PID control module.

**Disable Calibration Correction**

**Syntax**
SCtrlCalibAI,p1,p2,p3,p4

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Linearizer mode
  - Off Correction is not performed.

**Use Calibration Correction (Linearizer approximation, linearizer bias)**

**Syntax**

- **p1** Unit number
- **p2** Module number
- **p3** AI terminal number (AI1, AI2)
- **p4** Linearizer mode
  - Approx Linearizer approximation
  - Bias Linearizer bias
- **p5** Number of segmental points (2 to 12)
- **p6** Input value of segmental point 1
- **p7** Output value of segmental point 1
- **p8** Input value of segmental point 2
- **p9** Output value of segmental point 2
- **p10** Input value of segmental point 3 (number of segmental points ≥ 3)
- **p11** Output value of segmental point 3 (number of segmental points ≥ 3)
- **p12** Input value of segmental point 4 (number of segmental points ≥ 4)
- **p13** Output value of segmental point 4 (number of segmental points ≥ 4)
- **p14** Input value of segmental point 5 (number of segmental points ≥ 5)
Use Calibration Correction (Correction coefficient)

**Syntax**

SCtrlCalibAI,p1,p2,p3,p4,p5,p6,p7, p8,p9,p10,p11,p12,p13,p14,p15,p16, p17,p18,p19,p20,p21,p22,p23,p24,p 25,p26,p27,p28,p29,p30,p31,p32,p33 ,p34,p35,p36,p37,p38,p39,p40,p41,p42 Module number p3 AI terminal number (A1, A2) p4 Linearizer mode Correct Correction Factor p5 Number of correction points (2 to 12) p6 Uncorrected value 1 p7 Instrument correction coefficient 1 p8 Sensor correction coefficient 1 p9 Uncorrected value 2 p10 Instrument correction coefficient 2 p11 Sensor correction coefficient 2 p12 Uncorrected value 3 (number of segmental points ≥ 3) p13 Instrument correction factor 3 (number of segmental points ≥ 3) p14 Sensor correction factor 3 (number of segmental points ≥ 3) p15 Uncorrected value 4 (number of segmental points ≥ 4) p16 Instrument correction factor 4 (number of segmental points ≥ 4) p17 Sensor correction factor 4 (number of segmental points ≥ 4) p18 Uncorrected value 5 (number of segmental points ≥ 5) p19 Instrument correction factor 5 (number of segmental points ≥ 5) p20 Sensor correction factor 5 (number of segmental points ≥ 5) p21 Uncorrected value 6 (number of segmental points ≥ 6) p22 Instrument correction factor 6 (number of segmental points ≥ 6) p23 Sensor correction factor 6 (number of segmental points ≥ 6) p24 Uncorrected value 7 (number of segmental points ≥ 7) p25 Instrument correction factor 7 (number of segmental points ≥ 7) p26 Sensor correction factor 7 (number of segmental points ≥ 7) p27 Uncorrected value 8 (number of segmental points ≥ 8) p28 Instrument correction factor 8 (number of segmental points ≥ 8) p29 Sensor correction factor 8 (number of segmental points ≥ 8) p30 Uncorrected value 9 (number of segmental points ≥ 9) p31 Instrument correction factor 9 (number of segmental points ≥ 9) p32 Sensor correction factor 9 (number of segmental points ≥ 9) p33 Uncorrected value 10 (number of segmental points ≥ 10) p34 Instrument correction factor 10 (number of segmental points ≥ 10) p35 Sensor correction factor 10 (number of segmental points ≥ 10) p36 Uncorrected value 11 (number of segmental points ≥ 11) p37 Instrument correction factor 11 (number of segmental points ≥ 11) p38 Sensor correction factor 11 (number of segmental points ≥ 11) p39 Uncorrected value 12 (number of segmental points ≥ 12) p40 Instrument correction factor 12 (number of segmental points ≥ 12) p41 Sensor correction factor 12 (number of segmental points ≥ 12)

**Query Example**

Set three correction points on channel 0001 (measurement range: 0 to 1.0000 V). Set the correction points as follows: when the input value is 0 V, the output value is 0.0000 V; when the input value is 0.5000 V, the output value is 0.0010 V; when the input value is 1.0000 V, the output value is 0.9970 V.

```
SCtrlCalibAI,0001,Appro, 3,0,10,5000,5020,10000,9970
```
### SCtrlRangeAO

**Transmission Output**

Sets the transmission output range of the AO terminal of a PID control module.

**Syntax**

```
SCtrlRangeAO,p1,p2,p3,p4,p5,p6,p7
```

- **p1**: Unit number
- **p2**: Module number
- **p3**: AO terminal number (AO1, AO2)
- **p4**: Transmission output (On, Off)
  - Off
  - On
- **p5**: Terminal number
  - OUT1
  - PV1
  - SP1
  - OUT2
  - PV2
  - SP2
- **p6**: Scaling low limit (–30000 to 30000)
- **p7**: Scaling high limit (–30000 to 30000)

**Query**

```
SCtrlRangeAO[,p1,p2,p3]?
```

**Example**

Set the output of AO1 of module number 2 connected to the main unit to PV1.

```
SCtrlRangeAO,0,2,AO1,On,PV1,-30000,30000
```

**Description**

- This command is valid when a PID Control Module is installed.
- If p4=Off, you cannot set p5 and subsequent parameters.

---

### SCtrlOutput

**Control Output**

Sets the output type of the AO terminal of a PID control module.

**Syntax**

```
SCtrlOutput,p1,p2,p3,p4,p5,p6
```

- **p1**: Unit number
- **p2**: Module number
- **p3**: AO terminal number (AO1, AO2)
- **p4**: Control output type
  - Current-output
  - Voltage-pulse
  - VDC-power
  - 15 VDC power supply
- **p5**: Cycle time (5 to 10000)
  - 0.5 (s) to 1000.0 (s)
- **p6**: Analog output type
  - 4-20mA
  - 0-20mA
  - 20-4mA
  - 20-0mA

**Query**

```
SCtrlOutput[,p1]?
```

**Example**

Sets the AO1 output of module number 2 connected to the main unit to current, 800 s cycle time, and 4-20mA analog output type.

```
SCtrlOutput,0,2,AO1,Current-output,800,4-20mA
```

**Description**

- This command is valid when a PID Control Module is installed.

---

### SCtrlSplitAO

**Split Computation**

Sets the split computation of the AO terminal of the PID control module.

**Syntax**

```
SCtrlSplitAO,p1,p2,p3,p4,p5,p6,p7
```

- **p1**: Unit number
- **p2**: Module number
- **p3**: AO terminal number (AO1, AO2)
- **p4**: Linearizer mode (Off)
  - Off
  - On
- **p5**: Value at the segmental point for output 0% (-1000 to 2000)
- **p6**: Value at the segmental point for output 100% (-1000 to 2000)

**Query**

```
SCtrlSplitAO[,p1,p2,p3]?
```

**Example**

Set the output of AO1 of module number 2 connected to the main unit to PV1.

```
SCtrlSplitAO,0,2,AO1,Off,PV1,-1000,2000
```

**Description**

- This command is valid when a PID Control Module is installed.
- If p4=Off, you cannot set p5 and subsequent parameters.
### SCtrlRangePV

#### Control Input Range

Sets the control input range.

**Syntax**

```
SCtrlRangePV,p1,p2,p3,p4,p5
```

- `p1` Loop number
- `p2` PV range low limit (-30000 to 30000)
- `p3` PV range high limit (-30000 to 30000)
- `p4` PV range decimal place (0 to 4)
- `p5` Unit (up to 6 characters, UTF-8)

**Query**

```
SCtrlRangePV[,p1]?
```

**Example**

For loop number L022, set the PV range to -30000 to 30000, decimal place to 2, and unit to "UniA."

```
SCtrlRangePV,L022,-30000,30000,2,'UniA'
```

**Description**

- This command is valid when a PID Control Module is installed.
- Set PV range high and low limits (p2, p3) so that p2<p3 and p3–p2≤30000 are satisfied.

### SCtrlPVSwitch

#### Input Switching PV for PV Switching

Sets the input switching PV value for PV switching

**Syntax**

```
SCtrlPVSwitch,p1,p2,p3
```

- `p1` Loop number
- `p2` Input switching PV low limit (PV range low limit to PV range high limit)
- `p3` Input switching PV high limit (PV range low limit to PV range high limit)

**Query**

```
SCtrlPVSwitch[,p1]?
```

**Example**

For loop number L022, set the input switching PV value to -30000 to 30000.

```
SCtrlPVSwitch,L022,-30000,30000
```

**Description**

- This command is valid when a PID Control Module is installed.
- If the PV switching condition is set to low temperature range or high temperature range, set input switching PV low limit to a value less than input switching PV high limit. (See the SCtrlMode command.)

### SCtrlCalc

#### EXPV/RSP Function Setting

Sets the reference source of EXPV and RSP.

**Syntax**

```
SCtrlCalc,p1,p2,p3,p4
```

- `p1` Loop number
- `p2` PVSP number
- `p3` Channel type (IO, Math, Com, Off)
  - IO Input channel
  - Math Math channel (/MT)
  - Com Communication channel (/MC)
  - Off
- `p4` Channel number or terminal number
  - If p3=IO 0001 to 6532
  - If p3=Math 001 to 200
  - If p3=Com 001 to 500
  - If p3=AI 01 to 02

**Query**

```
SCtrlOutput[,p1]?
```

**Example**

For loop number L022, set EXPV of PV1 to channel A001.

```
SCtrlCalc,L022,EXPV,Math,001
```

**Description**

- This command is valid when a PID Control Module is installed.
- p2 can be set to EXPV1 or EXPV2 when the EXPV function is enabled.
- p2 can be set to RSP when the RSP function is enabled.
- p2 can be set to EXPV2 when the EXPV function is enabled and PV switching is used.
- p3 can be set to Off when the EXPV function is enabled, and p2=EXPV or EXPV2 in PV switching.

### SCtrlFilterSP

#### Remote SP Filter

Sets the remote SP filter.

**Syntax**

```
SCtrlFilterSP,p1,p2,p3
```

- `p1` Loop number
- `p2` Filter on/off
  - Off
  - On
- `p3` Filter value (1 to 120)
  - 1 to 120 s

**Query**

```
SCtrlFilterSP[,p1]?
```

**Example**

For loop number L022, set the remote SP filter to 120 s.

```
SCtrlFilterSP,L022,On,120
```

**Description**

- This command is valid when a PID Control Module is installed.
2.4 Setting Commands

**SCtrlRatioSP**

Remote SP Ratio
Sets the remote SP ratio.

**Syntax**

```
SCtrlRatioSP,p1,p2,p3
```

- **p1** Loop number
- **p2** Ratio setting on/off
  - Off
  - On
- **p3** Ratio value (1 to 9999)
  - 0.001 to 9.999 Fixed to three decimal places

**Query**

```
SCtrlFilterSP[,p1]?
```

**Example**

For loop number L022, set the remote SP filter to 120 s.
```
SCtrlFilterSP,L022,On,120
```

**Description**

- This command is valid when a PID Control Module is installed.

**SCtrlBiasSP**

Remote SP Bias
Sets the remote SP bias.

**Syntax**

```
SCtrlBiasSP,p1,p2,p3
```

- **p1** Loop number
- **p2** Remote bias on/off
  - Off
  - On
- **p3** Remote bias value (-100% to 100% of PV range span)

**Example**

For loop number L022, set the remote SP bias to -150.0.
```
SCtrlBiasSP,L022,On,-1500
```

**Description**

- This command is valid when a PID Control Module is installed.

**SCtrlErrPreOut**

Input Error Preset Output
Sets the output value for when input errors occur.

**Syntax**

```
SCtrlErrPreOut,p1,p2
```

- **p1** Loop number
- **p2** Preset output value for input error
  - PRESSET Preset output
  - OUT0% Control output 0%
  - OUT100% Control output 100%

**Query**

```
SCtrlErrPreOut[,p1]?
```

**Example**

For loop number L022, set the output value for when input errors occur to control output 100%.
```
SCtrlErrPreOut,L022,OUT100%
```

**Description**

- This command is valid when a PID Control Module is installed.

**SCtrlOutLimit**

Output Limiter Function in Manual Mode
Sets the output limiter function in manual mode.

**Syntax**

```
SCtrlOutLimit,p1,p2
```

- **p1** Loop number
- **p2** Output limiter switch
  - Off Disable the output limiter in manual mode.
  - On Enable the output limiter in manual mode.

**Query**

```
SCtrlOutLimit[,p1]?n
```

**Example**

For loop number L022, enable the output limiter function.
```
SCtrlOutLimit,L022,On
```

**Description**

- This command is valid when a PID Control Module is installed.

**SCtrlAlarm**

Control Alarm
Sets the control alarm type and action.

**Syntax**

```
SCtrlAlarm,p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,p13
```

- **p1** Loop number
- **p2** Alarm number (1 to 4)
- **p3** On/Off (Off, On)
- **p4** Type of alarm
  - PV-High PV high limit
  - PV-Low PV low limit
  - SP-High SP high limit
  - SP-Low SP low limit
  - Dev-High Deviation high limit
  - Dev-Low Deviation low limit
  - Dev-HL Deviation H/L limits
  - Dev-HL-In Deviation within H/L limits
  - OUT-High Control output high limit
  - OUT-Low Control output low limit
  - PV-Rate PV velocity
- **p5** Standby action
  - On
  - Off
- **p6** Hysteresis (0 to 30000)
- **p7** On delay timer (min) (0 to 99)
- **p8** On delay timer (sec) (0 to 59)
- **p9** Off delay timer (min) (0 to 99)
- **p10** Off delay timer (sec) (0 to 59)
- **p11** Relay action
  - off Nonhold
  - Relay1 Hold
  - Relay2 Relay action on hold & ACK
  - Reset
### Relay3
- Relay action on nonhold & ACK
- Reset
- Normal

### Relay4
- Relay action on hold & ACK
- Normal

### p12
- PV velocity alarm time setpoint (min) (0 to 99)

### p13
- PV velocity alarm time setpoint (sec) (0 to 59)

### Query
- SCtrlAlarm[,p1,p2]?

### Example
- For alarm number 8 of loop number L022, set the alarm type to PV high limit, no standby action, hysteresis to 150.5, on delay timer to 80min 00s, and relay action to normal.

### Description
- This command is valid when a PID Control Module is installed.
- The decimal place of p6 is synchronized to the control PV input range of SCtrlRangePV.
- The setting range of PV velocity alarm time is 0.01 to 99.59 (min, sec).
- PV velocity alarm time setpoint can be set when p4 is set to PV-Rate (PV velocity).

---

### SCtrlSP

#### SPNo Group Setting 2 (Target Setpoint Alarm)
Sets the target setpoint

**Syntax**

```
SCtrlSP,p1,p2,p3
```

- **p1** Loop number
- **p2** Target setpoint number (1 to 8)
- **p3** Target setpoint (target setpoint low limit to target setpoint high limit)

**Query**

```
SCtrlSP[,p1,p2]?
```

**Example**
- For loop number L022, set the target setpoint of target setpoint number 8 to -2500.5.

**Description**
- This command is valid when a PID Control Module is installed.

---

### SCtrlSPGradient

#### SPNo Group Setting 3 (Target Setpoint Ramp-Rate)
Sets the target setpoint ramp-rate

**Syntax**

```
SCtrlSPGradient, p1, p2,p3,p4,p5,p6
```

- **p1** Loop number
- **p2** Target setpoint number (fixed to “-”)
- **p3** Target setpoint ramp-down rate
  - Off
  - On
- **p4** Target setpoint ramp-down rate value
  - 0.0 + 1 digit to 100.0 (%) of the PV range span
  - Example 0.1 to 100.0° (1 to 1000) when the PV range is 0.0 to 100.0°

- **p5** Target setpoint ramp-up rate
  - Off
  - On

- **p6** Target setpoint ramp-up rate value
  - 0.0 + 1 digit to 100.0 (%) of the PV range span
  - Example 0.1 to 100.0° (1 to 1000) when the PV range is 0.0 to 100.0°

**Query**

```
SCtrlSPGradient[,p1]?
```

**Example**
- For loop number L022, set the ramp-down rate to 350.4 and the ramp-up rate to 580.9.

**Description**
- This command is valid when a PID Control Module is installed.
2.4 Setting Commands

**SCtrlPIDNo**

SPNo Group Setting 4 (PID Group Number)
Sets the target setpoint PID group number

Syntax
```
SCtrlPIDNo, p1, p2, p3
```
- `p1`: Loop number
- `p2`: Target setpoint number (1 to 8)
- `p3`: PID group number (1 to 8)

Query
```
SCtrlPIDNo[, p1, p2]?
```

Example
For loop number L022, set the PID group number of target setpoint number 8 to 3.
```
SCtrlPIDNo, 022, 8, 3
```

**Description**
- This command is valid when a PID Control Module is installed.
- The maximum value of `p3` is the number of SP groups set using `p3` of the `SCtrlSPPID` command.

**SCtrlRefDEV**

Zone PID Setting 3 (Reference Deviation)
Sets the zone PID reference deviation

Syntax
```
SCtrlRefDEV, p1, p2, p3
```
- `p1`: Loop number
- `p2`: Reference deviation on/off (Off, On)
- `p3`: Reference deviation (0% to 100% of PV range span)

Example
For loop number L022, set the reference deviation to 125.8.
```
SCtrlRefDEV, 022, 1258
```

**Description**
- This command is valid when a PID Control Module is installed.

**SCtrlPIDPb**

PID Parameter Setting 1 (Proportional Band)
Sets the proportional band

Syntax
```
SCtrlPIDPb, p1, p2, p3
```
- `p1`: Loop number
- `p2`: PID group number (1 to 8)
- `p3`: Proportional band `P` (1 to 9999)

Example
For loop number L022, set the proportional band `P` of PID group number 8 to 80.0%.
```
SCtrlPIDPb, 022, 8, 800
```

**Description**
- This command is valid when a PID Control Module is installed.

**SCtrlRHys**

Zone PID Setting 2 (Switching Hysteresis)
Sets the zone PID switching hysteresis

Syntax
```
SCtrlRHys, p1, p2
```
- `p1`: Loop number
- `p2`: Switching hysteresis

Example
For loop number L022, set the switching hysteresis to 30.8.
```
SCtrlRHys, 022, 308
```

**Description**
- This command is valid when a PID Control Module is installed.

**SCtrlPIDTI**

PID Parameter Setting 2 (Integration Time)
Sets the integration time

Syntax
```
SCtrlPIDTI, p1, p2, p3
```
- `p1`: Loop number
- `p2`: PID group number (1 to 8)
- `p3`: Integration time `I` (0 to 6000)

Example
For loop number L022, set the integration time of PID group number 8 to 240 s.
```
SCtrlPIDTI, 022, 8, 240
```

**Description**
- This command is valid when a PID Control Module is installed.
### SCtrlPIDTD

**PID Parameter Setting 3 (Derivative Time)**

Sets the derivative time

**Syntax**

```
SCtrlPIDTD, p1, p2, p3
```

- **p1** Loop number
- **p2** PID group number (1 to 8)
- **p3** Derivative time D (0 to 6000)

**Setting range:** 0 (OFF) to 6000 (s)

**Query**

```
SCtrlPIDTD [], p1, p2
```

**Example**

For loop number L022, set the derivative time of PID group number 8 to 60 s.

```
SCtrlPIDTD,L022,8,60
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlPIDPara

**PID Parameter Setting 4 (Other Controls)**

Sets control parameters

**Syntax**

```
SCtrlPIDPara, p1, p2, p3, p4, p5, p6, p7, p8, p9, p10
```

- **p1** Loop number
- **p2** PID group number (1 to 8)
- **p3** Control output low limit (-50 to 1050)
  
  **Setting range:** -5.0 to 105.0%
- **p4** Control output high limit (-50 to 1050)
  
  **Setting range:** -5.0 to 105.0%
- **p5** Tight shut function
  
  - Off
  
  - On
- **p6** Manual reset (-50 to 1050)
  
  **Setting range:** -5.0 to 105.0%
- **p7** Upper-side hysteresis
  
  0% to 100% of PV range span
- **p8** Lower-side hysteresis
  
  0% to 100% of PV range span
- **p9** Control direction
  
  - Reverse
  
  - Direct
- **p10** Preset output (-50 to 1050)
  
  **Setting range:** -5.0 to 105.0%

**Query**

```
SCtrlPIDPara [], p1, p2
```

**Example**

For loop number L022, set the proportional band P of the reference PID to 80.0%.

```
SCtrlPIDPara,L022,8,100,800,Direct,Reverse,100
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlRefPb

**Reference PID Setting 1 (Proportional Band)**

Sets the proportional band

**Syntax**

```
SCtrlRefPb, p1, p2
```

- **p1** Loop number
- **p2** Proportional band P (1 to 9999)
  
  **Setting range:** 0.1 to 999.9%

**Query**

```
SCtrlRefPb [], p1, p2
```

**Example**

For loop number L022, set the proportional band P of the reference PID to 80.0%.

```
SCtrlRefPb,L022,800
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlRefTI

**Reference PID Setting 2 (Integration Time)**

Sets the integration time

**Syntax**

```
SCtrlRefTI, p1, p2
```

- **p1** Loop number
- **p2** Integration time I (0 to 6000)
  
  **Setting range:** 0 (OFF) to 6000 (s)

**Query**

```
SCtrlRefTI [], p1, p2
```

**Example**

For loop number L022, set the integration time of the reference PID to 240 s.

```
SCtrlRefTI,L022,240
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlRefTD

**Reference PID Setting 2 (Derivative Time)**

Sets the derivative time

**Syntax**

```
SCtrlRefTD, p1, p2
```

- **p1** Loop number
- **p2** Derivative time D (0 to 6000)
  
  **Setting range:** 0 (OFF) to 6000 (s)

**Query**

```
SCtrlRefTD [], p1, p2
```

**Example**

For loop number L022, set the derivative time of the reference PID to 60 s.

```
SCtrlRefTD,L022,60
```

**Description**

- This command is valid when a PID Control Module is installed.
### SCtrlRefPara

**Reference PID Setting 4 (Other Controls)**

Sets control parameters

**Syntax**

```
SCtrlRefPara, p1, p2, p3, p4, p5, p6, p7, p8, p9
```

- **p1**: Loop number
- **p2**: Control output low limit (-50 to 1050)
  - Setting range: -5.0 to 105.0%
- **p3**: Control output high limit (-50 to 1050)
  - Setting range: -5.0 to 105.0%
- **p4**: Tight shut function
  - Off
  - On
- **p5**: Manual reset (-50 to 1050)
  - Setting range: -5.0 to 105.0%
- **p6**: Upper-side hysteresis
  - 0% to 100% of PV range span
- **p7**: Lower-side hysteresis
  - 0% to 100% of PV range span
- **Example**: 0.0 to 100.0° (0 to 900) when the PV range is 10.0 to 90.0°
- **p8**: Control direction
  - Reverse
  - Direct
- **p9**: Preset output (-50 to 1050)
  - Setting range: -5.0 to 105.0%

**Query**

```
SCtrlRefPara[,p1]?
```

**Example**

For the reference PID of loop number L022, set the output limit to 10% to 80%, tight shut function to On, manual reset to 40%, hysteresis to -30.0 to 50.0, control direction to reverse, and preset output to 10%.  

```
SCtrlRefPara,L022,100,800,On,400,-300,500,Reverse,100
```

**Description**
- This command is valid when a PID Control Module is installed.
- Set the control output high limit (p2) less than the control output low limit (p3).

### SCtrlDetail

**Control Detail Setting 1 (Tracking, Setpoint Limit, Ramp-Rate Time Unit)**

Sets the tracking, setpoint limit, and ramp-rate time unit

**Syntax**

```
SCtrlDetail, p1, p2, p3, p4, p5, p6
```

- **p1**: Loop number
- **p2**: Target setpoint tracking (Off, On)
  - Off
  - On
- **p3**: PV tracking (Off, On)
  - Off
  - On
- **p4**: Target setpoint low limit (PV range low limit to PV range high limit)
- **p5**: Target setpoint high limit (PV range low limit to PV range high limit)
- **p6**: Ramp-rate time unit (Hour, Min, Sec)
  - Hour
  - Hours
  - Min
  - Minutes
  - Sec
  - Seconds

**Query**

```
SCtrlDetail[,p1]?
```

**Example**

For loop number L022, set the target setpoint tracking to On, PV tracking to On, target setpoint limits to -300.0 to 300.0, and ramp-rate time unit to minutes.  

```
SCtrlDetail,L022,On,On,-3000,3000,Min
```

**Description**
- This command is valid when a PID Control Module is installed.
- Set the target setpoint high limit (p4) less than the target setpoint low limit (p5).

### SCtrlOutRatio

**Control Detail Setting 2 (Output Velocity Limiter)**

Sets the output velocity limiter

**Syntax**

```
SCtrlOutRatio, p1, p2, p3
```

- **p1**: Loop number
- **p2**: Output velocity limiter (Off, On)
  - Off
  - On
- **p3**: Output velocity limiter value (1 to 10000)
  - Setting range: 0.1 to 100.0%/s

**Query**

```
SCtrlOutRatio[,p1]?
```

**Example**

For loop number L022, set the output velocity limiter to 10.5 (%/s).  

```
SCtrlOutRatio,L022,On,105
```

**Description**
- This command is valid when a PID Control Module is installed.
### SCtrlAtDetail

**Control Detail Setting 3 (Auto-Tuning Details)**
Sets the auto-tuning details

**Syntax**

\[
\text{SCtrlAtDetail}, p_1, p_2, p_3, p_4, p_5
\]

- **p1** Loop number
- **p2** Type
  - NORMAL Normal
  - STABILITY Stability
- **p3** Output limiter low limit (-50 to 1050)
  - Setting range: -5.0 to 105.0%
- **p4** Output limiter high limit (-50 to 1050)
  - Setting range: -5.0 to 105.0%
- **p5** Bias (-100% to 100% of the PV range span)
  - Example: -90.0° to 90.0° for 10.0° to 100.0°

**Query**

\[
\text{SCtrlAtDetail}, p_1
\]

**Example**

For loop number L022, set the auto-tuning type to Stability, limiter to -5% to 90%, and bias to 150.0.

\[
\text{SCtrlAtDetail}, L022, \text{STABILITY}, -50, 900, 1500
\]

**Description**

- This command is valid when a PID Control Module is installed.
- Set the output limiter low limit (p3) less than the output limiter high limit (p4).

### SCtrlAntiReset

**Control Detail Setting 4 (Over-Integration Suppressing Function)**
Sets the over-integration suppressing function (anti-reset windup)

**Syntax**

\[
\text{SCtrlAntiReset}, p_1, p_2, p_3
\]

- **p1** Loop number
- **p2** Type
  - Auto Auto
- **p3** Deviation band (500 to 2000)
  - Setting range: 50.0 to 200.0%

**Query**

\[
\text{SCtrlAntiReset}, p_1
\]

**Example**

For loop number L022, set the deviation band of the over-integration suppressing function to 70.0%.

\[
\text{SCtrlAntiReset}, L022, \text{Manual}, 700
\]

**Description**

- This command is valid when a PID Control Module is installed.
- The selectable range of display group numbers (p1) varies depending on the model.

### SCtrlOvershoot

**Control Detail Setting 5 (Control Output Suppressing Function)**
Sets the control output suppressing function (overshoot-suppressing function)

**Syntax**

\[
\text{SCtrlOvershoot}, p_1, p_2
\]

- **p1** Loop number
- **p2** Control output suppressing function
  - Off Not Use
  - Normal Normal mode

**Query**

\[
\text{SCtrlOvershoot}, p_1
\]

**Example**

For loop number L022, set overshoot to normal mode.

\[
\text{SCtrlOvershoot}, L022, \text{Normal}
\]

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlGroupSW

**Control Group Use/Not**
Sets whether to use control groups

**Syntax**

\[
\text{SCtrlGroupSW}, p_1, p_2
\]

- **p1** Display group number
- **p2** Use/Not
  - Off Not Use
  - On Use

**Query**

\[
\text{SCtrlGroupSW}, p_1
\]

**Example**

Set the group of display group number 8 to not use.

\[
\text{SCtrlGroupSW}, 8, \text{Off}
\]

**Description**

- This command is valid when a PID Control Module is installed.
- The selectable range of display group numbers (p1) varies depending on the model.

### SCtrlGroupName

**Control Group Name**
Sets the control group name

**Syntax**

\[
\text{SCtrlGroupName}, p_1, p_2
\]

- **p1** Display group number (1 to 10)
  - GX10/GX20-1/GM10-1: 1 to 5
  - GX20-2/GM10-2: 1 to 10
- **p2** Group name (up to 16 characters, UTF-8)

**Query**

\[
\text{SCtrlGroupName}, p_1
\]

**Example**

Set the group name of display group number 8 to “Group8.”

\[
\text{SCtrlGroupName}, 8, \text{Group8}
\]

**Description**

- This command is valid when a PID Control Module is installed.
- The selectable range of display group numbers (p1) varies depending on the model.
### SCtrlGroupSplit

**Control Group Divisions [GX/GP]**

Sets the number of control group divisions

**Syntax**

```
SCtrlGroupSplit,p1,p2
```

- **p1** Display group number (1 to 10)
  - GX10/GX20-1/GM10-1: 1 to 5
  - GX20-2/GM10-2: 1 to 10
- **p2** Number of divisions (2, 4, 6, 8)
  - The number of divisions cannot be set to 8 on the GX10.

**Query**

```
SCtrlGroupSplit[,p1]?
```

**Example**

Set the number of divisions of display group number 8 to 4.

```
SCtrlGroupSplit,8,4
```

**Description**

- This command is valid when a PID Control Module is installed.
- The selectable range of display group numbers (p1) varies depending on the model.

### SCtrlTag

**Loop Tag, Tag Comment**

Sets the loop tag and tag comment

**Syntax**

```
SCtrlTag,p1,p2,p3,p4
```

- **p1** Loop number
- **p2** Tag (up to 32 characters, UTF-8)
- **p3** Tag No. (up to 16 alphanumeric characters, UTF-8)
- **p4** Type
  - INT
  - Loop

**Query**

```
SCtrlTag[,p1]?
```

**Example**

Assign L001, L002, L011, L012, L021, and L022 to the group with display group number 8.

```
SCtrlTag,L001,'L001','Ctrl-L001
```

**Description**

- This command is valid when a PID Control Module is installed.
- On the GX/GP, p3 cannot be set to On exceeding the number of divisions. (See the SCtrlGroupSplit command.)

### SCtrlDispDV

**Deviation Display Band (Control Group Display)**

Sets the deviation display band

**Syntax**

```
SCtrlDispDV,p1,p2
```

- **p1** Loop number
- **p2** Deviation display band (0% to 100% of PV range span)

**Example**

For loop number L022, set the deviation display band to 30.0.

```
SCtrlDispDV,L022,300
```

**Description**

- This command is valid when a PID Control Module is installed.

### SCtrlBackColor [GX/GP]

**Background color (Control Group Display)**

Sets the background color of the control group display.

**Syntax**

```
SCtrlBackColor,p1
```

- **p1** Background color
  - White
  - Black

**Example**

Set the background color of the control group display (Control group, Tuning, and Program) to black.

```
SCtrlBackColor,Black
```

**Description**

- This command is valid when a PID Control Module is installed.

---

2.4  Setting Commands
**SCtrlOutOperate**

**OUT Value Manual Output Operation Type (Control Group Display)**
Sets the OUT value manual output operation type

**Syntax**

```
SCtrlOutOperate, p1
```

- **p1** Confirmation method
  - **DIRECT** Confirm with direct operation
  - **SETENTER** Confirm with the ENTER key

**Query**

```
SCtrlOutOperate[,p1]?
```

**Example**

Confirm the OUT value with the ENTER key.
```
SCtrlOutOperate, SETENTER
```

**Description**

- This command is valid when a PID Control Module is installed.

**STagIO, SColorIO, SZoneIO, SScaleIO, SBarIO, SPartialIO, SValueIO**

**Control (PID) Channel Display Setting**
The channel display setting parameters of the control PID module are shared with other channels. For details, see each of the following commands.

- **Tag and tag number**: STagIO
- **Color**: SColorIO
- **Zone low limit, zone high limit**: SZoneIO
- **Scale display position, number of scale divisions**: SScaleIO
- **Bar display position, number of bar divisions**: SBarIO
- **Partial**: SPartialIO
- **Upper and lower limit string**: SValueIO

In addition, the following table shows the association between the PID control module channel types and commands.

<table>
<thead>
<tr>
<th>Command name</th>
<th>PV</th>
<th>SP</th>
<th>OUT</th>
<th>AI</th>
<th>AO</th>
<th>DI</th>
<th>DO</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

- **Y**: available, **N**: not available

---

**SPrgColor**

**Program Control Loop Color**
Sets the loop color

**Syntax**

```
SPrgColor, p1, p2, p3, p4
```

- **p1** Loop number
- **p2** R value of RGB colors (0 to 255)
- **p3** G value of RGB colors (0 to 255)
- **p4** B value of RGB colors (0 to 255)

**Query**

```
SPrgColor [,p1] ?
```

**Example**

Set Program Run/Reset message to On, automatic switch to program operation display to Off, and Program RUN detail settings to On.
```
SPrgDispDetail, On, Off, On
```

**Description**

- This command can be used when a PID control module is installed and the program control function (/PG option) is enabled.
  - For details on RGB values, see "Description" of the SColorIO command.

---

**SPrgDispDetail**

**Auto Message Printout, Automatic Switch To Program Operation Display, Other Display Settings**
Sets the detail settings for auto message printout, display switch, and start of program operation to On or Off.

**Syntax**

```
SPrgDispDetail, p1, p2, p3
```

- **p1** Program Run/Reset message
  - **Off**: Messages are not displayed.
  - **On**: Messages are displayed.

- **p2** Automatic switch to program operation display
  - **Off**: Not switched to the program operation display
  - **On**: Switched to the program operation display

- **p3** Detail settings at start of program operation
  - **Off**: Detail settings are not used (default value).
  - **On**: Detail settings are used.

**Query**

```
SPrgDispDetail [,p1] ?
```

**Example**

Set Program Run/Reset message to On, automatic switch to program operation display to Off, and Program RUN detail settings to On.
```
SPrgDispDetail, On, Off, On
```

**Description**

- This command can be used when a PID control module is installed and the program control function (/PG option) is enabled.
  - **p3** is a setting to set the start segment number and starting time of program operation at the start of program operation.
### SCtrlEventAct

**Control Event Action**

Sets a control event action

**When p2 (type) is set to Off**

**Syntax**

```
SCtrlEventAct, p1, p2
```

- **p1**: Registration number (1 to 100)
- **p2**: Type (Off)

**When p2 (type) is set to DI, DO, or internal switch**

**Syntax**

```
SCtrlEventAct, p1, p2, p3, p4, p5, p6, p7, p8, p9
```

- **p1**: Registration number (1 to 100)
- **p2**: Type (DI, DO, SW)
  - **DI**: DI
  - **DO**: DO
  - **SW**: Internal switch
- **p3**: Number
  - When P2=SW: 1 to 100
  - When P2=DI or DO: 0001 to 6932
- **p4**: Input/output type (In, Out)
  - **In**: Varies depending on P2 (DI, DO, SW). See the table below.
  - **Out**: Varies depending on P2 (DI, DO, SW). See the table below.
- **p5**: Status output content or operation content
  - Varies depending on P2 (DI, DO, SW). See the table below.
- **p6**: Pattern type (PATTERN_NO, WCONST)
  - **PATTERN_NO**: Program pattern number
  - **WCONST**: Variable constant W
- **p7**: Pattern number
- **p8**: Loop type
  - **LOOP_NO**: Loop number
  - **WCONST**: Variable constant W
- **p9**: Loop number

**Example**

Sets All loop control operation to stop when the internal switch number (SW1) becomes 0 to 1.

```
Use Control event action number 1.
SCtrlEventAct, 1, SW, 1, In, ALL_LP_STOP_Act
```

**Query**

```
SCtrlEventAct [, p1]
```

**Description**

- This command can be used when a PID control module is installed and the program control function (/PG option) is enabled.
- If you need multiple channels for p2 (event type) and p5 (action), use DI/DO/SW in the same module. The table below shows the number of used channels.

<table>

</tbody>
</table>
### 2.4 Setting Commands

#### SLogicMath

**Logic Math Expression (/MT)**

Sets the logic math expression

**Syntax**

```
SLogicMath, p1, p2, p3
```

- **p1** Math number
- **p2** Expression on/off
  - Off  Not Use
  - DO  DO channel
  - SW  Internal switch
- **p3** Channel number
- **p4** Calculation expression (up to 120 alphanumeric characters, UTF-8)

**Query**

```
SLogicMath[,p1]?
```

**Example**

Output the math result of expression 0001AND0002 as 0 or 1 to DO channel number 0105. Use Logic math number 1.

```
SLogicMath,1,DO,0105,’0001AND0002’
```

**Description**

- You cannot use this command to configure settings while recording is in progress.
- p3 can be set only for DO or SW with type set to Manual.
- This command can be used when the math function (/MT) is enabled.

#### SWConst

**Variable Constant (/MT)**

Sets the variable constant to be used in computation

**Syntax**

```
SWConst, p1, p2
```

- **p1** Variable constant number (1 to 100)
- **p2** Value (–9.999999E+29 to 9.999999E+30, five significant digits)

**Query**

```
SWConst[,p1]?
```

**Example**

Set variable constant number 12 to 1.0000E–10.

```
SWConst,12,1.0000E-10
```

**Description**

- You can change the constant even during recording, computing, and controlling.
- This command can be used when the math function (/MT) is enabled.

</tbody>
</table>

1. LP = loop number (1 to 652), EVT = PV/time event number (1 to 32)
2. Save behavior on each module. (Example: 001 and 002 are the same.)
2.5 Output Commands

FData

Outputs the Most Recent Channel Data
Outputs the most recent I/O channel, math channel, and communication channel data.
Syntax  

\[ \text{FData}, p_1, p_2, p_3 \]

- \( p_1 \) Output format
  - 0 The most recent data in ASCII format
  - 1 The most recent data in binary format
- \( p_2 \) First channel
- \( p_3 \) Last channel

Example

Output the most recent data of channels 0001 to 0210 in ASCII format.
\[ \text{FData}, 0, 0001, 0210 \]

Description

- If you omit \( p_2 \) and \( p_3 \), all channels will be output.
- Channel ranges whose first channel and end channel are different channel types are interpreted as follows:
  
<table>
<thead>
<tr>
<th>First Channel</th>
<th>Last Channel</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>A200</td>
<td>0001 to 9999, A001 to A200</td>
</tr>
<tr>
<td>A001</td>
<td>C500</td>
<td>A001 to A200, C001 to C500</td>
</tr>
<tr>
<td>C001</td>
<td>A200</td>
<td>Not allowed (will result in error)</td>
</tr>
<tr>
<td>A001</td>
<td>0001</td>
<td>Not allowed (will result in error)</td>
</tr>
</tbody>
</table>

- For the ASCII output format, see page 2-121.
- For the binary output format, see page 2-178.

FRelay

Outputs the Most Recent Relay and Internal Switch Status
Outputs the most recent relay (DO channel) and internal switch status.
Syntax  

\[ \text{FRelay}, p_1 \]

- \( p_1 \) Output information
  - 0 The most recent relay (DO channel) status in ASCII format
  - 1 The most recent internal switch status in ASCII format

Example

Output the relay (DO channel) status.
\[ \text{FRelay}, 0 \]

Description

- For the output format, see page 2-122 or page 2-124.

FTransStatAO

Latest Re-transmission State Output
Outputs the latest re-transmission (AO channel) state
Syntax  

\[ \text{FTransStatAO}, p_1 \]

- \( p_1 \) Fixed to 0

Example

Output the re-transmission state.
\[ \text{FTransStatAO}, 0 \]

Description

- For the output format, see page 2-124.

FFifoCur

Outputs Channel FIFO Data
Outputs the I/O channel, math channel, and communication channel FIFO data.
Acquire the FIFO Data
Syntax  

\[ \text{FFifoCur}, p_1, p_2, p_3, p_4, p_5, p_6, p_7 \]

- \( p_1 \) FIFO data output (0)
- \( p_2 \) Scan group (1 or 2)
- \( p_3 \) First channel
- \( p_4 \) Last channel
- \( p_5 \) Read start position (-1, 0 to 999999999999)
- \( p_6 \) Read end position (-1, 0 to 999999999999)
- \( p_7 \) Maximum number of blocks to read (1 to 9999)

Example

Read the measured data of channels 0001 to 0020. Set the read start position to 180 and the read end position to the most recent position. Set the maximum number of blocks to read to 9999.
\[ \text{FFifoCur}, 0, 0001, 0020, 180, -1, 9999 \]

Acquire the FIFO Data Read Range
Syntax  

\[ \text{FFifoCur}, p_1, p_2 \]

- \( p_1 \) FIFO read range output (1)
- \( p_2 \) Scan group (1 or 2)

Example

Acquire the current readable range.
\[ \text{FFifoCur}, 1, 1 \]

Description

- For the binary output format, see page 2-181.
- \( p_2 = 2 \) is valid when the measurement mode is set to dual interval.
### FSnap
**Snapshot [GX/GP]**
Outputs a snapshot data (screen image data) file.

**Syntax**  
FSnap,p1  
  p1 Screen image data output (GET)

**Example**  
Acquire screen image data.  
FSnap,GET

**Description**  
- A PNG image file will be stored in the data block of the binary output file (see page 2-119).

### FUser
**Outputs the User Level**
Outputs information about the users who are currently logged in.

**Syntax**  
FUser,p1  
  p1 Information about the users who are currently logged in  
  0 Refer to your own user information.  
  1 Refer to information about all users who are currently logged in.  
  2 Refer to information 2 of the user who is currently logged in  
  3 Refer to information 2 of all users who are currently logged in

**Example**  
Refer to information about all users who are currently logged in.  
FUser,1

**Description**  
- For the ASCII output format, see page 2-126.

### FAddr
**Outputs the IP Address**
Outputs the recorder IP address information.

**Syntax**  
FAddr,p1  
  p1 Address output (IP)  
  Output address information that includes the IP address, subnet mask, default gateway, and DNS server as well as the host name and domain name.

**Example**  
Output the recorder IP address information.  
FAddr,IP

**Description**  
- For the ASCII output format, see page 2-130.

### FStat
**Outputs the Recorder Status**
Outputs the recorder status.

**Syntax**  
FStat,p1  
  p1 Status output (0)  
  0 Status 1 to 4 output  
  1 Status 1 to 8 output

**Example**  
Output the recorder status.  
FStat,0

**Description**  
- For the ASCII output format, see page 2-131.

### FLog
**Outputs the Log**
Outputs the alarm summary, message summary, error log, etc.

**Syntax**  
FLog,p1,p2,p3  
  p1 Status output (0)  
  ALARM Alarm summary  
  MSG Message summary  
  EVENT Event log  
  ERROR Error log  
  DHCP Ethernet address setting log  
  GENERAL General communication log  
  MODBUS Modbus log  
  FTP FTP client log  
  SNTP SNTP client log  
  MAIL E-mail log  
  WEB Web log  
  SLMP SLMP log  
  CALARM Control alarm summary log  
  CTRL Control summary log  
  p2 Maximum log readout length  
  p3 Batch group number  
  All All batch group numbers  
  1 to the number used

**Example**  
Output 600 alarm summary entries.  
FLog,ALARM,600

**Description**  
- For the ASCII output format, see page 2-134.  
- p3 is valid when multi batch is in use and p1={alarm, msg, event}. Omitting it is equivalent to specifying all batch groups.
## 2.5 Output Commands

### FEventLog

**Outputs a Detail Event Log (/AS)**

Outputs an event log. You can specify the event, user, etc.

**Syntax**

```
FEventLog,p1,p2,p3,p4,p5
```

- **p1** Output format
  - 0: The same output format as Flog, EVENT (no detailed information).
  - 1: Include detailed information

- **p2** User name
  - Up to five user names can be specified by separating each user with a colon.

- **p3** Event specification (specified with an event string)
  - Up to five events can be specified by separating each user with a colon. Events will be searched using a prefix search.

- **p4** Maximum number of output (1 to 400)

- **p5** Batch group number
  - All: All batch group numbers
  - 1 to the Batch group number used

**Example**

Output the log of up to 10 “message001” writing operations by User01.

```
FEventLog,1,User01,Message001,10
```

**Description**

- Omitting `p2` is equivalent to specifying all users.
- If more than five users are specified by `p2`, only the first five users will be valid.
- Omitting `p3` is equivalent to specifying all events.
- If more than five events are specified by `p3`, only the first five events will be valid.
- For the event strings of `p3`, see section 2.10.23 Detail Event Log Output (FEventLog) (/AS).
- This command can be used only when the multi batch function (/BT) is enabled. Omitting `p5` is equivalent to specifying all batch groups.

### FMEDIA

**Outputs External Storage Medium and Internal Memory Information**

Outputs external storage medium and internal memory information.

**File list**

**Syntax**

```
FMEDIA,p1,p2,p3,p4
```

- **p1** Output type (DIR)
- **p2** Path name (up to 100 characters)
- **p3** File list output start position (1 to 99999999)
- **p4** File list output end position (1 to 99999999, -1)

**Example**

Output all the file lists in the DRV0 directory.

```
FMEDIA,DIR,/DRV0/
```

**Data in Files**

**Syntax**

```
FMEDIA,p1,p2,p3,p4
```

- **p1** Output type (GET)
- **p2** Path name (up to 100 characters)
- **p3** Data output start position (in bytes) (0 to 2147483647)
- **p4** Data output end position (in bytes) (0 to 2147483647, -1)

**Example**

Output all the data in file xyz in the DRV0/DATA0 directory.

```
FMEDIA,GET,/DRV0/DATA0/xyz
```

**Description**

- If you omit `p3` and `p4`, the maximum file size (as large as the recorder internal communication buffer allows) will be output.
- The file data will be stored in the data block of the binary output file (see page 2-119).

### Free Space on the External Storage Medium

**Syntax**

```
FMEDIA,p1
```

- **p1** Output type (CHKDSK)

**Example**

Output the free space on the external storage medium.

```
FMEDIA,CHKDSK
```

**Description**

- For the ASCII output format, see page 2-158.
### FCnf

**Outputs Setting Data**

Outputs the recorder setting data.

**Syntax**

```
FCnf, p1
```

**p1**

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>Read all settings.</td>
</tr>
<tr>
<td>IO</td>
<td>Read I/O settings.</td>
</tr>
<tr>
<td>MATH</td>
<td>Read Math settings.</td>
</tr>
<tr>
<td>COMM</td>
<td>Read communication settings.</td>
</tr>
<tr>
<td>GROUP</td>
<td>Read display group settings.</td>
</tr>
<tr>
<td>IP</td>
<td>Read IP address settings.</td>
</tr>
<tr>
<td>SECURITY</td>
<td>Read security settings.</td>
</tr>
<tr>
<td>MULTIBATCH</td>
<td>Read multi batch settings.</td>
</tr>
<tr>
<td>CTRL</td>
<td>Read control settings.</td>
</tr>
<tr>
<td>CALIB</td>
<td>Read calibration correction settings.</td>
</tr>
<tr>
<td>SERVER</td>
<td>Read Ethernet server related settings.</td>
</tr>
<tr>
<td>INSTRU</td>
<td>Read device information settings.</td>
</tr>
<tr>
<td>OTHERS</td>
<td>Read settings other than above.</td>
</tr>
</tbody>
</table>

You can specify multiple items in the list above. Separate each item with a colon (see the example).

**Example**

Read I/O and Math settings.

```
FCnf, IO:MATH
```

**Description**

- If you omit p1, all settings will be read.
- The setting data is output as the responses to the command queries. The following table lists p1 values (setting category) and the corresponding commands.

**Setting Category and Target Commands**

<table>
<thead>
<tr>
<th>Setting category</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO</td>
<td>SModeAI, SModeAICurrent, SModeDI, SModePID, SScaleOver, SBOIetAlCurrent, SRgaeAI, SRageDI, SRangePulse, SRangeDI, SRangeAO, SMoveAve, SFilt, SBurnOut, SRjc, SAlarmIO, SAlmHysIO, SAlmDlyIO, STagIO, SColorIO, SZoneIO, SScaleIO, SBarIO, SPartialIO, SBandIO, SAlmMarkIO, SValueIO, SpresetAO</td>
</tr>
<tr>
<td>COMM</td>
<td>SRangeCom, SValueCom, SWebCom, SAlarmCom, SAlmHysCom, SAlmDlyCom, STagCom, SColorCom, SZoneCom, SScaleCom, SBarCom, SPartialCom, SBandCom, SAlmMarkCom, SCalibUseCom, SCAlibCom</td>
</tr>
<tr>
<td>GROUP</td>
<td>SGroup, STripLine, SClkBmp, SDualGroup</td>
</tr>
<tr>
<td>IP</td>
<td>SAddrAddress, SDns, SDhcp</td>
</tr>
<tr>
<td>SECURITY</td>
<td>SKdc, SSecurity, SopPass, SopLimit, SUser, SUserLimit, SSignIn, SSignInTitle, SSignInLimit, SBTPassword, SWBCustomMenu, SWWebTimeOut, SSessionSecurity</td>
</tr>
<tr>
<td>MULTIBATCH</td>
<td>SMTTextField, SMTFileName, SMTGrp, SMTTripline, SMTSlcBmp</td>
</tr>
<tr>
<td>CTRL</td>
<td>SCtrlMode, SCtrlScan, SCtrlAction, SCtrlType, SCtrlLoopAction, SCtrlSPID, SCtrlALNo, SCtrlAlmMode, SCtrlDIRegist, SCtrlRelay, SCtrlRangeAI, SCtrlBurnOut, SCtrlRjc, SCtrlFilter, SCCtrlAIcalibAI, SCCtrlRangeAO, SCCtrlSprintAO, SCCtrlOutput, SCCtrlRangePV, SCCtrlPVSwitch, SCCtrlCalc, SCCtrlFilterSP, SCCtrlRatiosSP, SCCtrlBmaxSP, SCtrlErrPreOut, SCCtrlOutputLimit, SCCtrlAlarm, SCCtrlAlarmVal, SCCtrlSPGradient, SCCtrlPIDNo, SCCtrlRefPoint, SCCtrlRhys, SCCtrlRefDEy, SCCtrlPIDPb, SCCtrlPIDTI, SCCtrlPIDDD, SCCtrlPIDPara, SCCtrlRefPb, SCCtrlRefTI, SCCtrlRefTD, SCCtrlRefPara, SCCtrlDetail, SCCtrlOutputRatio, SCCtrlAtDetail, SCCtrlAntiReset, SCCtrlOvershoot, SCCtrlGroupSW, SCCtrlGroupName, SCCtrlGroupSplit, SCCtrlGroup, SCCtrlTag, SCCtrlDispDV, SCCtrlBackColor, SCCtrlOutputOperate, SPrColor, SPrDispDetail, SCCtrlEventAct, SLogiMath, SSWConstant</td>
</tr>
<tr>
<td>CALIB</td>
<td>SCalibAIIO, SSchedule, SScheduleText, SCalibUseCom, SCalibCom</td>
</tr>
<tr>
<td>SERVER</td>
<td>SServerEncrypt, SServer, SDarwinCnvCh, SDarwinPortLimit</td>
</tr>
<tr>
<td>INSTRU</td>
<td>SBTID, SInstruTag</td>
</tr>
</tbody>
</table>

For the output format, see page 2-159.
## 2.5 Output Commands

### FChInfo

**Outputs Decimal Place and Unit Information**

Outputs decimal place and unit information.

**Syntax**

```
FChInfo,p1,p2
```

- `p1` First channel
- `p2` Last channel

**Example**

Output the decimal place and unit information of channels 0001 to 0003.

```
FChInfo,0001,0003
```

**Description**

- If you omit `p1` and `p2`, all channels will be output.
- For the output format, see page 2-159.

### FBTDevInfo

**Bluetooth Device Information Output [GM]**

Outputs the Bluetooth device information of the recorder.

**Syntax**

```
FBTDevInfo,p1
```

- `p1` Bluetooth device information output (0)

**Example**

Output the Bluetooth device information of the connected device.

```
FBTDevInfo,0
```

**Description**

- `p1` can be omitted.
- For the output format, see page 2-162.

### FSysConf

**Queries the System Configuration and Reconfigures Modules**

Queries the System Configuration, Reconfigures Modules, and Performs Activation.

**Query the System Configuration**

**Syntax**

```
FSysConf
```

**Example**

Query the System Configuration.

```
FSysConf
```

**Reconfigures Modules**

Aligns the module configuration settings that are recognized by the recorder and the actual module configuration.

**Syntax**

```
FSysConf,p1
```

- `p1` Module reconfiguration (1)

**Example**

Reconfigure the modules.

```
FSysConf,1
```

**Activate module**

Modules need to be activated when the firmware in installed modules is updated or when modules are recalibrated.

**Syntax**

```
FSysConf,p1
```

- `p1` Activate module (3)

**Example**

Activate modules.

```
FSysConf,3
```

**Description**

- `p1 = 3` is valid when the advanced security function (/AS) is enabled.

### FReminder

**Outputs Reminder Information (/AH)**

Outputs reminder information.

**Syntax**

```
FReminder,p1
```

- `p1` Reminder information designation
  - `ALL` Specifies all schedule numbers
  - 1 or 12 Schedule number

**Example**

Output the reminder information for schedule number 3.

```
FReminder,3
```

**Description**

- This command is valid when the aerospace heat treatment (/AH) option is enabled.
- Omitting `p1` is equivalent to specifying all registration numbers.
- For the output format, see page 2-163.

### FCtrlData

**Control Data Output**

Outputs the most recent control data.

**Syntax**

```
FCtrlData,p1,p2,p3
```

- `p1` Output format
  - 0 ASCII format
  - 1 Binary format
- `p2` First loop number
- `p3` Last loop number

**Example**

Output the most recent data of loop number 001

```
FCtrlData,L001
```

**Description**

- If you omit `p2` and `p3`, all loop numbers will be output.
- Only the information of detected modules will be output.
- The data time outputted is not the time of a control period but the data acquisition time by a communication command.
- For the ASCII output format, see page 2-164.
- For the Binary output format, see page 2-182.
### FCtrlNo

**SP Number and PID Number Output**
Outputs the SP number and PID number

**Syntax**
```
FCtrlNo,p1,p2
p1 First loop number
p2 Last loop number
```

**Example**
Output the SP number and PID number of loop number 001 currently in use.
```
FCtrlNo,L001
```

**Description**
- If you omit p1 and p2, all loop numbers will be output.
- If you omit p2, p2 is set to the same loop number as p1.
- Only the information of detected modules will be output.
- For the output format, see [page 2-165].

### FCtrlMode

**Control Mode Output**
Outputs the control mode

**Syntax**
```
FCtrlMode,p1,p2
p1 First loop number
p2 Last loop number
```

**Example**
Output the control mode of loop number 001.
```
FCtrlMode,L001
```

**Description**
- If you omit p1 and p2, all loop numbers will be output.
- If you omit p2, p2 is set to the same loop number as p1.
- Only the information of detected modules will be output.
- For the output format, see [page 2-165].

### FPrgMode (/PG)

**Program Operation Mode Output**
Outputs the program operation mode

**Syntax**
```
FPrgMode,p1
p1 Program pattern number (1 to 99)
```

**Example**
Output the program operation mode of program pattern number 1.
```
FPrgMode,1
```

**Description**
- This command is valid when the program control function (/PG option) is in use.
- During the program operation, when the selected program pattern is not being executed, an error occurs.
- When program operation is stopped, the information at the end of operation is output only when the selected program pattern matches the program pattern that was executed last.
- For the output format, see [page 2-166].

### FPrgEvent (/PG)

**PV Event and Time Event Information Output**
Outputs information about PV events and time events occurring in the program pattern

**Syntax**
```
FPrgEvent,p1
p1 Program pattern number (1 to 99)
```

**Example**
Output information about PV events and time events of program pattern number 1.
```
FPrgEvent,1
```

**Description**
- This command is valid when the program control function (/PG option) is in use.
- When program operation is stopped, “0” is output for PV events and time events.
- For the output format, see [page 2-169].

### FPrgEnd (/PG)

**Program Control End Signal Status Output**
Outputs the program control end signal status

**Syntax**
```
FPrgEnd,p1
p1 Program pattern number (1 to 99)
```

**Example**
Output the program control end signal status of program pattern number 1.
```
FPrgEnd,1
```

**Description**
- This command is valid when the program control function (/PG option) is in use.
- This command can output the program control end signal status for about 5 seconds after the program operation ends normally.
- The program control end signal is not output when the operation is terminated by force (terminated through reset).
- When program operation is stopped, “0” is output.
- For the output format, see [page 2-170].
FPrgPtnCur (/PG)

Running Program Pattern Number and Status Output

Outputs the running program pattern number and status

Syntax

FPrgPtnCur

Example

Output the running program pattern number and status.

FPrgPtnCur

Description

• This command is valid when the program control function (/PG option) is in use.
• When program operation is stopped, EA<crlf>EN<crlf> is returned.
• For the output format, see page 2-170.
2.6 Operation

Commands

OSetTime

Sets the Time

Sets the time.

Syntax

OSetTime,p1

p1 Time to set

“YYYY/MO/DD:HH:MI:SS” (the underscore denote a space), “YYYY/MO/DD”, or “HH:MI:SS.”

YYYY Year (2001 to 2035)

MO Month (01 to 12)

DD Day (01 to 31)

HH Hour (00 to 23)

MI Minute (00 to 59)

SS Second (00 to 59)

Query

OSetTime?

The OSetTime query outputs the recorder current time.

Example

Set the time to 23:00:00 on May 24, 2013.

OSetTime,2013/05/24 23:00:00

ORec

Starts or Stops Recording

Starts or stops recording.

Syntax

ORec,p1,p2

p1 Recording start or stop

0 Start

1 Stop

p2 Batch group number

All All batch group numbers

1 to the number used

Example

Start recording.

ORec,0

Description

• p2 is valid when multi batch (BT) is enabled.
• Omitting p2 is equivalent to specifying all batch group numbers.

OAlarmAck

Clears Alarm Output

Clears alarm output (performs an alarm ACK).

Syntax

OAlarm Ack,p1

p1 Alarm output clearance (0)

Example

Clear the alarm output.

OAlarm Ack,0

Individual alarm ACK

Syntax

OAlarmAck,p1,p2,p3

p1 Individual alarm output clearance (1)

p2 Channel number

p3 Alarm level (1 to 4)

Example

Clear the alarm output of alarm 3 of channel 0001.

OAlarm Ack,1,0001,3

Individual Alarm ACK (for control alarms)

Syntax

OAlarmAck,p1,p2

p1 Separate alarm output clearance (2)

p2 Loop number

Example

Clear the alarm output of loop L122.

OAlarm Ack,2,122

Description

• If you send an individual alarm ACK command when

  the individual alarm ACK function is not in use, no

  action is taken, and a normal response is returned.

OExecRec

Generates a Manual Trigger, Executes
Manual Sample, Takes a Snapshot, or
Causes a Timeout

Generates a manual trigger, executes manual sample, takes a snapshot, or divides the data being recorded into separate files.

Syntax

OExecRec,p1,p2

p1 Action type

(GX/GP: 0, 1, 2, 3, 4)

(GM: 0, 1, 3, 4)

0 Execute manual sampling.

1 Generate a manual trigger.

2 Take a snapshot.

3 Cause a display data timeout (divide files).

4 Cause an event data timeout (divide files).

p2 Batch group number

All All batch group numbers

1 to the number used

Example

Execute manual sampling.

OExecRec,0

When the measurement mode is set to dual interval

p1 Action type

1 Generate a manual trigger.

p2 Scan group number
2.6 Operation Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Scan Group</strong></td>
<td>Select a scan group.</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td>When the measurement mode is dual interval, apply a trigger to scan group 2.</td>
</tr>
</tbody>
</table>

**Description**
- Manual trigger (p1 = 1) cannot be executed when the advanced security function (/AS) is enabled.
- If a manual sample is executed (p1 = 0) when there are no source channels for manual sampling, a file without any source channels will be created.
- p2 is valid when multi batch is enabled and p1=3 or 4.
- p2 is valid when the measurement mode is set to dual interval and p1=1.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OExecSNTP</strong></td>
<td>Queries the time using SNTP.</td>
</tr>
</tbody>
</table>

**Syntax**
OExecSNTP,p1

**Example**
Query the time using SNTP.
OExecSNTP,0

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OMessage</strong></td>
<td>Write a message.</td>
</tr>
</tbody>
</table>

**Write a Preset Message**

**Syntax**
OMessage,p1,p2,p3,p4

**Example**
Write the message in preset message number 8 to display groups 1 and 2.
OMessage,PRESET,8,1:2

**Description**
- p4 is valid when multi batch is enabled. This cannot be omitted.

**Write a Free Message**

**Syntax**
OMessage,FREE,p1,p2,p3,p4,p5

**Example**
Write a free message “MARK” as message number 2 in display groups 3, 8, and 11.
OMessage,FREE,2,3:8:11,’MARK’

**Description**
- p5 is valid when multi batch is enabled. This cannot be omitted.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OPassword</strong></td>
<td>Changes the password.</td>
</tr>
</tbody>
</table>

**Syntax**
OPassword,p1,p2,p3

**Example**
Change the password from “PASS001” to “WORD005.”
OPassword,’PASS001’,’WORD005’,’WORD005’

**Description**
- For the characters that you can use for the password, see Appendix 1.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>OMath</strong></td>
<td>Starts, stops, or resets computation or clears the computation dropout status display.</td>
</tr>
</tbody>
</table>

**Syntax**
OMath,p1,p2

**Example**
Start computation.
OMath,0

**Description**
- You cannot use this command while the recorder is saving or loading setup data.
• p2 is valid when multi batch is enabled and p1=2 (reset computation).
• Omitting p2 is equivalent to specifying all math channels.

**OSaveConf**

**Saves Setting Data**
Saves the recorder setting data to the recorder’s external storage medium.

**Syntax**

\[ \text{OSaveConf\{p1,p2,p3\}} \]

- **p1** File name (up to 80 characters, ASCII)
  Specify the path and file name, excluding the extension.
- **p2** Medium
  (GX/GP: SD, USB)
  (GM: SD)
  SD SD memory card
  USB USB flash memory
- **p3** Setting file comment (up to 50 characters, UTF-8)

**Example**

Save setting data to a file named “SETFILE1” to the SD memory card.

**OSaveConf,’SETFILE1’,SD**

**Description**

- If you omit p3, the default setting file comment will be added. You can edit the default setting file comment from the recorder front panel.

**OSaveConfAll**

**Saves Setting Data at Once**
Saves the setting data to the specified folder in the external storage medium.

**Syntax**

\[ \text{OSaveConfAll\{p1,p2\}} \]

- **p1** Folder name (up to 80 characters, ASCII)
  Specify the path name+folder name.
- **p2** Medium
  (GX/GP: SD, USB)
  (GM: SD)
  SD SD card
  USB USB Flash Memory

**Example**

Save the setting data collectively to the “CONFIG0” folder of the SD memory card.

**OSaveConfAll,’CONFIG0’,SD**

**Description**

- If you omit parameter p2, the medium is set to the SD card.
- The following items are saved. File names are indicated in parentheses.
  - Setting data file (Config.GNL or Config.GSL)
  - Scale image [GX/GP only]
    (ScaleImageXX.png) where XX is the display group
  - Report template (Report_YY.xlsx, Report_YY.xlsm, or Report_YY.tpl)
    YY is the report type.
  - Trusted certificate
  - A “Client” folder is created in the specified folder (p1), and the data is saved there.
  - Server certificate
    A “Server” folder is created in the specified folder (p1), and the data is saved there.
  - Custom display (GX/GP only)
    Creates a (Setting.GCS) setting file, a folder indicating the custom display number in the specified folder (p1), and saves data there.
  - Program pattern file (*.GPT)
    A “ProgramPattern” folder is created in the specified folder (p1), and the data is saved there.
  - The folder name is constrained by the same limitations as the data save destination folder setting (see the explanation of SDirectory). For example, a folder named “ABC” can be created but not “ ABC”, which contains spaces in the beginning.

**OCommCh**

**Sets a Communication Channel to a value**
Sets a communication channel to a value.

**Syntax**

\[ \text{OCommCh\{p1,p2\}} \]

- **p1** Communication channel
- **p2** Value
  The setting range is as follows:
  \(-9.9999999E+29 \text{ to } -1.0000000E\text{–}30, 0, 1.0000000E\text{–}30 \text{ to } 9.9999999E+29\)
  The number of significant digits is 8.

**Query**

\[ \text{OCommCh\{,p1\}?} \]

**Example**

Set communication channel C001 to 2.5350.

**OCommCh,C001,2.5350**

**Description**

• The description of execution and response errors are not recorded in the event log.
• Custom display commands cannot be executed.

**OEmail**

**Starts or Stops the E-mail Transmission Function**
Starts or stops the e-mail transmission function.

**Syntax**

\[ \text{OEmail\{p1\}} \]

- **p1** Action type
  0 Start the e-mail transmission function.
  1 Stop the e-mail transmission function.

**Example**

Start the e-mail transmission function.

**OEmail,0**
### 2.6 Operation Commands

#### OMBRestore

**Recover Modbus manually**

Resumes command transmission from Modbus client or Modbus master to devices in which communication errors have occurred.

**Syntax**

```
OMBRestore,p1
```

- `p1` Action type
  - 0 Modbus client (Ethernet)
  - 1 Modbus master (serial)

**Example**

Manually recover the Modbus client.

```
OMBRestore,0
```

---

#### ORTReset

**Resets a Relative Timer**

Resets a relative timer.

**Syntax**

```
ORTReset,p1
```

- `p1` Timer type
  - 0 All timers
  - 1 to 12 Timer number
  - Multiple selection is possible by delimiting with colons.

**Example**

Reset relative timer 2.

```
ORTReset,2
```

Reset relative timers 4, 9, and 12.

```
ORTReset,4:9:12
```

#### OMTReset

**Resets the Match Time Timer**

Resets the match time timer.

**Syntax**

```
OMTReset,p1
```

- `p1` Timer type
  - 0 All timers
  - 1 to 12 Timer number
  - Multiple selection is possible by delimiting with colons.

**Example**

Reset match time timer 2.

```
OMTReset,2
```

Reset match time timers 4, 9, and 12.

```
OMTReset,4:9:12
```

#### OCmdRelay

**Outputs the DO Channel and Internal Switch Status**

Outputs the DO channel and internal switch status.

**Syntax**

```
OCmdRelay,p1
```

- `p1` Specification of a setting
  - Express the setting. Set a channel status as follows: [channel number]-[status]. Use a hyphen as a separator.

- You can specify the following values for the channel number.
  - DO channel number
  - Internal switch number
- You can specify the following values for the status.
  - Off: Off status
  - On: On status
- You can specify the status of multiple channels at once. To do so, use a semicolon to separate channels as follows: [channel number]-[status]: [channel number]-[status]. . . You can specify up to a total of 32 channels that consist of DO channels and internal switches.

**Example**

Set channels 0101, 0102, and 0103 to On and internal switches S001 and S002 to Off.

```
```

---

#### OBatName

**Sets a Batch Name**

Sets a batch name.

**Syntax**

```
OBatName,p1
```

- `p1` Batch group number
  - When multi batch is disabled: Always 1
  - When multi batch is enabled: 1 to the number used
- `p2` Batch number (up to 32 characters, ASCII)
- `p3` Lot number (0 to 99999999, up to eight digits, depending on Lot-No. digit)

**Query**

```
OBatName[,p1]?
```

**Example**

Set the batch name structure to batch number “PRESSLINE” and the lot number 007.

```
OBatName,1,’PRESSLINE’,007
```

**Description**

- For the characters that you can use in the specified batch number (p2), see Appendix 1.
- You cannot set the batch number to a single space character. Doing so will clear the batch number.
### Commands and Responses

#### OBatComment

**Sets a Batch Comment**

Sets a batch comment.

**Syntax**

```plaintext
OBatComment,p1,p2,p3
```

- `p1`: Batch group number
  - When multi batch is disabled: Always 1
  - When multi batch is enabled: 1 to the number used
- `p2`: Comment number (1 to 3)
- `p3`: Comment string (up to 50 characters, UTF-8)

**Query**

```plaintext
OBatComment[,]p1[,p2]?
```

**Example**

Set comment number 2 to “THIS PRODUCT IS COMPLETED.”

```plaintext
OBatComment,1,2,‘THIS PRODUCT IS COMPLETED’
```

**Description**

- You cannot set the comment string to a single space character. Doing so will clear the comment string.

#### OBatText

**Sets a Batch Text**

Sets a batch text.

**Syntax**

```plaintext
OBatText,p1,p2,p3,p4
```

- `p1`: Batch group number
  - When multi batch is disabled: Always 1
  - When multi batch is enabled: 1 to the number used
- `p2`: Field number (1 to 24)
- `p3`: Field title (up to 20 characters, UTF-8)
- `p4`: Field string (up to 30 characters, UTF-8)

**Query**

```plaintext
OBatText[,]p1[,]p2]?
```

**Example**

For field number 1, set the title to “Ope” and the character string to “GX.”

```plaintext
OBatText,1,’Ope’,’GX’
```

**Description**

- You cannot set the field title or field string to a single space character. Doing so will clear them.

#### ODispRate

**Switches the Trend Interval [GX/GP]**

Switches between first trend interval (normal trend interval) and second trend interval.

**Syntax**

```plaintext
ODispRate,p1
```

- `p1`: Trend interval
  - NORMAL: First trend interval (normal trend interval)
  - SECOND: Second trend interval

**Example**

Switch from first trend interval to second trend interval.

```plaintext
ODispRate,SECOND
```

**Description**

- Set the second trend interval with the STrdRate command.

#### OLoadConf

**Loads Setting Data**

Loads a setting data file from the recorder external storage medium into the recorder.

**Syntax**

```plaintext
OLoadConf,p1,p2,p3,p4
```

- `p1`: File name (up to 80 characters, ASCII)
  - Specify the path and file name, excluding the extension.
- `p2`: Medium
  - (GX/GP: SD, USB)
  - (GM: SD)
  - SD: SD memory card
  - USB: USB flash memory
- `p3`: Settings to load
  - ALL: All settings
  - SECURITY: Security settings only
  - CONTROL: Control
  - IP: IP address settings only
  - OTHERS: All settings except for security and IP address settings

Multiple options can be selected for `p3`. To do so, separate items with a colon. To specify items to be excluded from the items specified by `p3=OTHERS`, set `p4`.

- `p4`: Setting items to be excluded from the items specified by `p3=OTHERS`
  - SERVER: Server related settings
  - CALIB: Calibration correction settings
  - INSTRU: Instrument information settings

Multiple options can be selected for `p4`. To do so, separate items with a colon.

**Example**

Load all settings from the setting file “SETTING1” on the SD memory card.

```plaintext
OLoadConf,’SETTING1’,SD,ALL
```

Load security and IP address settings from a setting file named “SETTING1” from the SD memory card.

```plaintext
OLoadConf,’SETTING1’,SD,SECURITY:IP
```

Load settings excluding IP address settings, server related settings, and instrument information, from a setting file named “SETTING1” from the SD memory card.

```plaintext
OLoadConf,’SETTING1’,SD,SECURITY:OTHERS:SERVER:INSTRU
```

**Description**

- If you omit parameter `p2`, the medium is set to the SD memory card.
- For `p3` and `p4` values (setting category) and target commands, see Setting Category and Target Commands on page 2-97.
- If you omit parameter `p3`, all settings will be loaded.
- If you omit parameter `p4`, no setting will be excluded.
- If you change the language with this command, the recorder may restart.
2.6 Operation Commands

**OLoadConfAll**

_Loads Setting Data at Once_ 
Loads all settings from the specified folder of the external storage medium.

**Syntax**  
`OLoadConfAll, p1, p2`

- **p1** Folder name (up to 80 characters)  
  Specify the folder name as “path name+folder name.”
- **p2** Medium (SD)  
  (GX/GP: SD, USB)  
  (GM: SD)  
  SD SD card  
  USB USB flash memory

**Example**  
Load all settings from the "CONFIG0" folder of the SD card.  
`OLoadConfAll,'CONFIG0',SD`

**Description**
- The following items are loaded into the GX/GP/GM. File names are indicated in parentheses.
  - Setting data file (Config.GNL or Config.GSL)
  - Scale image (GX/GP only)  
    (ScaleImageXX.png) where XX is the display group
  - Report template (Report_YY.xlsx, Report_YY.xlsm, or Report_YY.tpl)  
    YY is the report type.
  - Trusted certificate  
    The certificate file in the “Client” folder in the specified folder (p1) is loaded.
  - Custom display (GX/GP only)  
    Loads the (Setting.GCS) setting file and the settings in each folder indicating a custom display number in the specified folder (p1).
  - Program pattern file (*.GPT)  
    The program pattern file in the “ProgramPattern” folder in the specified folder (p1) is loaded.

**OSeriApply**

_Applies Serial Communication Settings_ 
Applies serial communication settings.

**Syntax**  
`OSeriApply, p1`

- **p1**  
  Apply the settings (0).

**Example**  
Apply serial communication settings.  
`OSeriApply,0`

**Description**
- This command applies the serial communication settings specified by the **SSerialBasic** command.
- When you send this command, the serial communication settings take effect when the recorder returns a response. After this process, the connection will be cut off.

**OIPApply**

_Applies the IP Address_ 
Applies Ethernet communication settings.

**Syntax**  
`OIPApply, p1`

- **p1**  
  Apply the settings (0).

**Example**  
Apply the IP address settings.  
`OIPApply,0`

**Description**
- This command applies the IP address settings specified by the **SIpAddress**, **SDhcp**, **SDns**, and **SServer** commands.
- When you send this command, the IP address settings take effect when the recorder returns a response. After this process, the connection will be cut off. This includes Ethernet connections to other devices (Modbus server, FTP server, etc.).

**OInit**

_Clears Measured Data and Initializes Setting Data_ 
Clears the measured data in internal memory. The command also initializes setting data.

**Syntax**  
`OInit, p1, p2`

- **p1**  
  The types of data to be initialized and cleared  
  SECURITY Security settings  
  Memory Display data, event data, manual sampled data, report data, alarm summary, message summary  
  OTHERS Settings other than those above  
  ALL All measured data and settings

- **p2**  
  Setting items to be excluded from the items specified by p1=OTHERS.  
  IP IP address settings  
  SERVER Server related settings  
  CALIB Calibration correction settings  
  INSTRU Instrument information settings

You can specify multiple items at once. To do so, separate items with a colon. If p1 is set to ALL, nothing is excluded.

**Example**  
Delete the measured data and summary from the internal memory.  
`OInit, MEMORY`

- Initializes the settings excluding IP address settings and instrument information.  
  `OInit, MEMORY:SECURITY:OTHERS, IP:INSTRU`

**Description**
- IP address settings are those set with the **SIpAddress**, **SDns**, **SDhcp**, and **SDhcp** commands.
- For p1 and p2 values (setting category) and target commands, see Setting Category and Target Commands on page 2-97.
- If you omit parameter p2, no setting will be excluded.
**OUsbFApply**

Applies USB Communication Settings [GM]

Applies USB communication settings.

**Syntax**

```
OUsbFApply,p1
```

**Example**

Apply the USB communication On/Off setting specified with the SUbsFunction command.

```
OUsbFApply,0
```

---

**OBTApply**

Applies Bluetooth Communication Settings (/C8) [GM]

Applies Bluetooth communication settings.

**Syntax**

```
OBTApply,p1
```

**Example**

Apply the Bluetooth communication On/Off setting specified with the SBluetooth command.

```
OBTApply,0
```

---

**OBTClearList**

Clears the Bluetooth Connection List (/C8) [GM]

Clears the Bluetooth connection list.

**Syntax**

```
OBTClearList
```

**Example**

Clear the connected Bluetooth connection list.

```
OBTClearList
```

---

**OLoginAssist**

Assists Login [GX/GP]

Assists logging in to the recorder, during bar-code input.

**Syntax**

```
OLoginAssist,p1,p2,p3
```

**Example**

Log in with the user name “User01.”

```
OLoginAssist,1,’User01’
```

**Description**

- When this command is executed, the recorder shows the login screen and waits for a user password and user ID input.
- `p1 = 2` is valid when the advanced security function (/AS) is enabled.
- `p3` is valid when `p1 = 2`. However, when the user ID is not used, `p3` is invalid.
- This command is valid when the serial communication function (the SSerialBasic command) is set to Barcode or the USB input device (the SUbsInput command) is set to Barcode.

---

**OSendValue**

Assists Touch Panel Operation Input [GX/GP]

Assists text input during touch panel operation.

**Syntax**

```
OSendValue,p1,p2
```

**Example**

On the message settings screen, enter the message “START” (display the message settings screen and select the text box for entering the message string in advance).

```
OSendValue,0,’START’
```

**Description**

- Input into a text area that displays asterisks (*****) is not possible.
- This command is valid when the serial communication function (the SSerialBasic command) is set to Barcode or the USB input device (the SUbsInput command) is set to Barcode.

---

**OUserLockACK**

User Locked ACK (/AS)

Clears the user locked display.

**Syntax**

```
OUserLockACK
```

**Example**

Clears the user locked display.

```
OUserLockACK
```

**Description**

- This command can be executed only when the user is logged in as an administrator.
- If there are no locked users, nothing will take place.

---

**OKeyLock**

Key Lock On/Off [GM]

Turns key lock on or off.

**Syntax**

```
OKeyLock,p1
```

**Example**

Release the key lock.

```
OKeyLock,Off
```

**Description**

- Turning the key lock on will lock the START, STOP, USER1, and USER2 keys. You cannot lock the key individually.
- Only administrator level users can turn key lock on and off.
- This command is invalid when the advanced security function (/AS) is enabled and the log in via communication is enabled.
2.6  Operation Commands

**OErrorClear**

Clears the Error Display [GM]
Clears the error display status from the 7 segment LED.

**Syntax**

\[ \text{OErrorClear, p1} \]

- **p1** Error display clear type
  - 0 Error display clear

**Example**

Clear the error display status from the 7 segment LED.
\[ \text{OErrorClear, 0} \]

**OSLMPRestore**

Manually Restores SLMP (/E4)
Resumes command transmission from SLMP client to devices in which communication errors have occurred.

**Syntax**

\[ \text{OSLMPRestore, p1} \]

- **p1** Fixed to 0

**Example**

Manually recover the SLMP client.
\[ \text{OSLMPRestore, 0} \]

**OTransChAO**

Individual Re-transmission Control
Controls the re-transmission of AO channels individually

**Syntax**

\[ \text{OTransChAO, p1} \]

- **p1** Re-transmission value specification
  - Express the re-transmission value.
    - You can specify the following values for the status.
      - Off: Off status
      - On: On status
    - You can specify the status of multiple channels at once. To do so, use a semicolon to separate channels as follows: [channel number]-[status]. Use a hyphen as a separator.
    - You can specify the status of multiple channels at once. To do so, use a semicolon to separate channels as follows: [channel number]-[status]. You can specify up to 32 channels.

**Example**

Set re-transmission of channels 0101, 0102, and 0103 to On and that of channels 201 and 202 to Off.
\[ \text{OTransChAO, 0101-On:0102-On:0103-On:201-Off:202-Off} \]

**OTransAllAO**

Collective re-transmission control
Controls the re-transmission of AO channels collectively

**Syntax**

\[ \text{OTransAllAO, p1} \]

- **p1** Re-transmission enabled or disabled.
  - On Re-transmission is enabled.
  - Off Re-transmission is disabled.

**Example**

Set re-transmission to Off.
\[ \text{OTransAllAO, Off} \]

**OInitPara**

Individual Setting Parameter Initialization
Initializes setting parameters individually

**Syntax**

\[ \text{OInitPara, p1} \]

- **p1** Setting parameters to initialize
  - RecCh Recording channels
  - Group Display groups

**Example**

Initialize recording channels and display groups.
\[ \text{OInitPara, RecCh:Group} \]
Display groups are those specified by the SGroup, STripLine, SSclBmp, SMltGroup, SMltTripLine, SMltSclBmp, or SDualGroup commands.

**OCtrlAM**

Auto/Manual/Cascade Operation Switching
Switches the control operation mode

**Syntax**

```
OCtrlAM, p1, p2
```

- `p1`: Loop number
- `p2`: Auto/manual/cascade switching
  - 0: Auto (Auto)
  - 1: Manual (Man)
  - 2: Cascade (Cas)

**Example**

Set the operation mode of unit 1, slot 5, loop 2 to manual.

```
OCtrlAM,L152,1
```

**Description**

- This command is valid when a PID Control Module is installed.
- If `p2=2` (Cas), E0 is returned when cascade control is enabled and E1 when disabled.
- When the module is not installed, E1 is returned.

**OCtrlSR**

Operation Run/Stop Switching
Switches between operation run (RUN) and operation stop (STOP)

**Syntax**

```
OCtrlSR, p1, p2
```

- `p1`: Loop number (L000 or L001 to L652)
- `p2`: Operation run/stop switching
  - 0: Run
  - 1: Stop

**Example**

Stop the operation of unit 1, slot 5, loop 2.

```
OCtrlSR,L152,1
```

**Description**

- This command is valid when a PID Control Module is installed.
- When `p1=L000`, all loops are specified.
- Operation is not possible while a program pattern is being executed. (Possible in local mode)
- When the module is not installed, E1 is returned.

**OCtrlRL**

Remote/Local Switching
Switches between remote and local modes

**Syntax**

```
OCtrlRL, p1, p2
```

- `p1`: Loop number
- `p2`: Remote/Local Switching
  - 0: Local
  - 1: Remote

**Example**

Set the input of unit 1, slot 5, loop 1 to remote.

```
OCtrlRL,L151,1
```

**Description**

- This command is valid when a PID Control Module is installed.
- The remote switching (`p2=1`) operation during program pattern execution is the same as the program switching of program operation (OCtrlMode command).
- When the module is not installed, E1 is returned.

**OCtrlAT**

Auto-Tuning Request
Starts or stops auto-tuning

**Syntax**

```
OCtrlAT, p1, p2
```

- `p1`: Loop number
- `p2`: Auto-tuning start/stop
  - 0: Auto-tuning stop
  - 1 to 8: Start auto-tuning PID numbers
  - 9: Start auto-tuning reference deviation PID

**Example**

Start auto-tuning of PID number 5 of loop 1.

```
OCtrlAT,L001,5
```

**Description**

- This command is valid when a PID Control Module is installed.
- The response when start or stop is specified with `p2` is as follows according to the status at that point.
  - Change from a stopped state: E0
  - Stop from a running state: E0
  - Start from a running state: E1
- When the module is not installed, E1 is returned.

**OCtrlSPN**

Selects the Target Setpoint Number
Sets the target setpoint (SP) number

**Syntax**

```
OCtrlSPN, p1, p2
```

- `p1`: Loop number
- `p2`: Target setpoint number SP1 to SP8 (1 to 8)

**Example**

Set the target setpoint number of unit 1, slot 5, loop 2 to 5.

```
OCtrlNoSPN,L152,5
```

**Description**

- This command is valid when a PID Control Module is installed.
- When the module is not installed, E1 is returned.
### OCtrlMO

**Sets the Manual Output Setpoint**  
Sets the manual output setpoint  
**Syntax**  
OCtrlMO,p1,p2,p3  
- p1: Loop number  
- p2: Type  
  - 0: Numeric input  
  - 1: Shutdown (light shut function)  
- p3: Manual output setpoint (-50 to 1050 [-5.0% to 105.0%])  
  - Within the output high and low limits  
**Example**  
Set the output value of unit 1, slot 5, loop 2 to 23.4%.  
OCtrlMO,L152,0,234  
Set the output value of unit 1, slot 5, loop 2 to shutdown.  
OCtrlMO,L152,1  
**Description**  
- This command is valid when a PID Control Module is installed.  
- You cannot set p3 if p2 is set to 1.  
- When the module is not installed, E1 is returned.

### OCtrlHOLD

**Hold Program Operation (/PG)**  
**Syntax**  
OCtrlHOLD,p1  
- p1: Holding of program operation  
  - 0: Release hold  
  - 1: Hold  
**Example**  
Release the holding of program operation.  
OCtrlHOLD,0  
**Description**  
- This command is valid when the program control function (/PG option) is in use.  
- This operation is applied to the pattern number specified with OCtrlPat.  
- When program operation is stopped, E1 is returned.

### OCtrlADV

**Advances Program Operation (/PG)**  
**Syntax**  
OCtrlAdv,p1  
- p1: Segment advance  
  - 1: Fixed (Advance)  
**Example**  
Request a segment advance during program operation.  
OCtrlAdv,1  
**Description**  
- This command is valid when the program control function (/PG option) is in use.  
- This operation is applied to the pattern number specified with OCtrlPat.  
- When program operation is stopped, E1 is returned.

### OCtrlSP

**Sets the Target Setpoint (/PG)**  
Sets the target setpoint (SP).  
**Syntax**  
OCtrlSP,p1,p2  
- p1: Loop number  
- p2: Target setpoint (PV range low limit to PV range high limit)  
**Example**  
Set the target setpoint of unit 1, slot 5, loop 2 to 2.5350.  
OCtrlSP,L152,2.5350  
**Description**  
- This command is valid when the program control function (/PG option) is in use.  
- Operation is possible only when the program operation is being held.  
- If p2 is set to a value outside the range or if the program hold is released (program is running), E1 is returned.  
- This operation is applied to the pattern number specified with OCtrlPat.  
- When program operation is stopped, E1 is returned.

### OCtrlIPAT

**Pattern Number Switching (/PG)**  
Switches the program pattern number  
**Syntax**  
OCtrlIPAT,p1  
- p1: Pattern number switching (1 to 99)  
**Query**  
OCtrlIPAT?  
**Example**  
Switch to program pattern 2.  
OCtrlIPAT,2  
**Description**  
- This command is valid when the program control function (/PG option) is in use.  
- You can set p1 regardless of whether the pattern file is available.

### OCtrlMode

**Program Operation (/PG)**  
Switches between program operation run and stop  
**Syntax**  
OCtrlMode,p1  
- p1: Program operation mode change  
  - 0: Start of program operation (Prog)  
  - 1: Stop of program operation (Reset)  
**Example**  
Start program operation.  
OCtrlMode,0  
**Description**  
- This command is valid when the program control function (/PG option) is in use.  
- This operation is applied to the pattern number specified with OCtrlPat.  
- When the module is not installed, E1 is returned.
### OCtrlTSP

**Sets the Final Target Setpoint (/PG)**

Sets the final target setpoint (TSP)

**Syntax**

```
OCtrlTSP, p1, p2
p1 Loop number
p2 Final target setpoint (PV range low limit to PV range high limit)
```

**Example**

Set the final target setpoint of unit 1, slot 5, loop 2 to 2.5350.

```
OCtrlTSP,L152,2.5350
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- Operation is possible only when the program operation is being held.
- If p2 is set to a value outside the range or if the program hold is released (program is running), E1 is returned.
- This operation is applied to the pattern number specified with OCtrlPat.
- When program operation is stopped, E1 is returned.

### OCtrlRTIME

**Sets the Segment Remaining Time (/PG)**

Sets the remaining segment time

**Syntax**

```
OCtrlRTIME, p1, p2, p3
p1 Hour (0 to 99)
p2 Minute (0 to 59)
p3 Second (0 to 59)
```

**Example**

Set the remaining segment time to 11 hours 05 minutes 22 seconds.

```
OCtrlRTIME,11,05,22
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- Operation is possible only when the program operation is being held.
- If the program hold is released (program is running), E1 is returned.
- This operation is applied to the pattern number specified with OCtrlPat.
- When program operation is stopped, E1 is returned.

### OCtrlStSeg

**Sets the Start Segment Number (/PG)**

Sets the start segment of program operation

**Syntax**

```
OCtrlStSeg, p1, p2
p1 Pattern number (1 to 99)
p2 Segment number (1 to the number of segments in use)
```

**Query**

```
OCtrlStSeg[,p1]?
```

**Example**

Set the start segment of program pattern number 2 to 3.

```
OCtrlStSeg,2,3
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- E1 is returned in the following cases.
  - Program pattern with the number specified by p1 is running.
  - Program pattern file for the number specified by p1 cannot be found.
  - The segment number specified by p2 is greater than the number of segments in use.
- When the program is reset, the start number returns to segment number 1.

### OCtrlDlyTime

**Sets the Starting Time of Program Operation (/PG)**

Sets the delay time between the start of program operation to when the program pattern operation actually starts.

**Syntax**

```
OCtrlDlyTime, p1, p2, p3, p4
p1 Pattern number (1 to 99)
p2 Hour (0 to 99)
p3 Minute (0 to 59)
p4 Second (0 to 59)
```

**Query**

```
OCtrlDlyTime[,p1]?
```

**Example**

Set the operation start delay time of program pattern number 2 to 5 minutes 55 seconds.

```
OCtrlDlyTime,2,0,5,55
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- E1 is returned in the following cases.
  - Program pattern with the number specified by p1 is running.
  - Program pattern file for the number specified by p1 cannot be found.
- When the program is reset, the delay time is reset to 00:00:00.
2.6 Operation Commands

**OCtrlLoadPAT**

Loads a Pattern File (/PG)
Loads a program pattern file

**Syntax**

```
OCtrlLoadPAT, p1, p2, p3
```

- **p1** File name (up to 80 characters)
- **p2** Medium
  - (GX/GP: SD, USB)
  - (GM: SD)
  - SD SD memory card
  - USB USB flash memory
- **p3** Load destination
  - Pattern file number (1 to 99)

**Example**

Load the program pattern file “PATTERN1” from the SD memory card to pattern file number 1.

```
OCtrlLoadPAT, 'PATTERN1', SD, 1
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- If you omit parameter p2, the medium is set to the SD card.

**OCtrlSavePAT**

Saves a Pattern File (/PG)
Saves a program pattern file

**Syntax**

```
OCtrlSavePAT, p1, p2, p3
```

- **p1** File name (up to 80 characters)
- **p2** Medium
  - (GX/GP: SD, USB)
  - (GM: SD)
  - SD SD memory card
  - USB USB flash memory
- **p3** Save source
  - Pattern file number (1 to 99)

**Example**

Save the program pattern file of pattern file number 1 to a file named “PATTERN1” in the SD memory card.

```
OCtrlSavePAT, 'PATTERN1', SD, 1
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- If you omit parameter p2, the medium is set to the SD card.

**OCtrlLoadPATAll**

Collectively Loads Pattern Files (/PG)
Collectively Loads program pattern files

**Syntax**

```
OCtrlLoadPATAll, p1, p2
```

- **p1** Folder name (up to 80 characters)
- **p2** Medium
  - (GX/GP: SD, USB)
  - (GM: SD)
  - SD SD memory card
  - USB USB flash memory

**Example**

Collectively load program pattern files from the “Pattern” folder in the SD memory card.

```
OCtrlLoadPATAll, Pattern, SD
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- If you omit parameter p2, the medium is set to the SD card.
- All pattern files in the folder are loaded.
- Only the pattern files with the following fixed file names in the specified folder are loaded.
  - File name: ProgPatXX.YYY
  - XX: Pattern number (01 to 99)

**OCtrlSavePATAll**

Collectively saves Pattern Files (/PG)
Collectively saves program pattern files

**Syntax**

```
OCtrlSavePATAll, p1, p2
```

- **p1** Folder name (up to 80 characters)
- **p2** Medium
  - (GX/GP: SD, USB)
  - (GM: SD)
  - SD SD memory card
  - USB USB flash memory

**Example**

Collectively save program pattern files to the “Pattern” folder in the SD memory card.

```
OCtrlSavePATAll, Pattern, SD
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- If you omit parameter p2, the medium is set to the SD card.
- All pattern files are saved.
- Files are saved with fixed file names in the specified folder.
  - File name: ProgPatXX.YYY
  - XX: Pattern number (01 to 99)

**OCtrlDelPAT**

Deletes a Pattern File (/PG)
Deletes a program pattern file

**Syntax**

```
OCtrlDelPAT, p1
```

- **p1** Pattern file number (1 to 99)

**Example**

Delete pattern file number 99.

```
OCtrlDelPAT, 99
```

**Description**

- This command is valid when the program control function (/PG option) is in use.
- If you omit parameter p2, the medium is set to the SD card.
2.7 Communication Control Commands

CCheckSum

Sets the Checksum
Sets the presence or absence of checksum.
Syntax  
CCheckSum,p1
  p1  Checksum usage
      0  Do not compute
      1  Compute
Query
Example  Enable the checksum.
        CCheckSum,1

CSFilter

Sets the Status Filter
Sets the filter used when outputting the recorder status.
Syntax  
CSFilter,p1
  p1  Filter values for status information
      numbers 1 to 4 (0.0.0.0 to 255.255.255.255)
Query  
Example  Set the status filter value to 255.127.63.31.
        CSFilter,255.127.63.31

Description
• The status filter is applied to each communication connection.

CSFilterDB

Sets the status filter (expanded)
Sets the filter used when outputting the recorder status.
Syntax  
CSFilterDB,p1,p2
  p1  Filter values for status information
      numbers 1 to 4 (0.0.0.0 to 255.255.255.255)
  p2  Filter values for status information
      numbers 5 to 8 (0.0.0.0 to 255.255.255.255)
Query  
Example  Set the status filter value of status information
        1 to 4 to 255.127.63.31 and that of status
        information 5 to 8 to 1.2.3.4.
        CSFilterDB,255.127.63.31,1.2.3.4

Description
• The status filter is applied to each communication connection.
• p2 can be omitted.

CLogin

Log in over a Communication Path
Logs in over a communication path.
Syntax  
CLogin,p1,p2
  p1  User name
  p2  password
Example  Log in using the user name "admin" and
         password "password."
         CLogin,admin,password

Description
• For the characters that you can use for the password,
  see Appendix 1.
• If this command is executed while logged in, the user
  is once logged out and then logged back in.

When Using the Advanced Security Function (AS)
Syntax  
CLogin,p1,p2,p3,p4,p5
  p1  User name
  p2  User ID
  p3  Password
  p4  The new password when the password
      has expired
  p5  The new password when the password
      has expired for confirmation
Example  Log in using the user name "admin01" and
         password "password01."
         CLogin,admin01,,password01

Description
• If p4 and p5 are not specified, normal login will be
  used.
• Even if the password has not expired, you can enter
  a new password in p4 in p5 to change the password
  and log in.
• If p4 and p5 are not the same, an error will occur.
• You cannot change to the same password (if p3 is the
  same as p4 and p5, an error will occur).
• If the user ID is not used, p2 is invalid.
• When using the password management, you cannot
  specify p4 and p5.
• For the characters that you can use for the password,
  see Appendix 1.
• If this command is executed while logged in, the user
  is once logged out and then logged back in.

CLogout

Log Out over a Communication Path
Logs out over a communication path.
Syntax  
CLogout
Example  Logs out from the recorder.
         CLogout
### CBTConnect

**Starts Bluetooth Communication (/C8) [GM]**

Starts Bluetooth communication.

**Syntax**

```pl
CBTConnect,p1
```

`p1` Bluetooth password of the device you want to connect to

**Example**

Connect to the device whose Bluetooth password is "PaSsworD2."

```pl
CBTConnect,'PaSsworD2'
```

**Description**

- This command is valid only when a Bluetooth password request has been received via Bluetooth communication. If the command is invalid, error 352, "Unknown command," will occur.

### ESC O

**Opens an Instrument : RS-422/485 Command**

Starts communication with the recorder. ESC in ASCII code is 0x1B. For details, see Appendix 1.

**Syntax**

```pl
ESC O_p1
```

`p1` Instrument address (01 to 99)

**Example**

Open the instrument at address 99.

```pl
ESC O 99
```

**Description**

- Specify the address of the instrument that you want to communicate with.
- You can only open one instrument at any given time.
- Use a capital "O."
- For this command, use CR+LF for the terminator.
- For the responses to this command, see page 2-120.

### ESC C

**Closes an Instrument : RS-422/485 Command**

Ends communication with the recorder. ESC in ASCII code is 0x1B. For details, see Appendix 1.

**Syntax**

```pl
ESC C_p1
```

`p1` Instrument address (01 to 99)

**Example**

Close the instrument at address 77.

```pl
ESC C 77
```

**Description**

- This command closes the connection to the instrument you are communicating with.
- Use a capital "C."
- For this command, use CR+LF for the terminator.
- For the responses to this command, see page 2-120.
2.8 Instrument Information
Output Commands

_MFG
Outputs the Instrument Manufacturer
Syntax _MFG
Description
• For the ASCII output format, see page 2-171.

_INF
Outputs the Instrument’s Product Name
Syntax _INF
Description
• For the ASCII output format, see page 2-171.

_COD
Outputs the Instrument’s Basic Specifications
Syntax _COD
Description
• For the ASCII output format, see page 2-172.

_VER
Outputs the Instrument’s Firmware Version Information
Syntax _VER
Description
• For the ASCII output format, see page 2-172.

_OPT
Outputs the Instrument’s Option Installation Information
Syntax _OPT
Description
• For the ASCII output format, see page 2-173.

_TYP
Outputs the Instrument’s Temperature Unit and Daylight Saving Time Installation Information
Syntax _TYP
Description
• For the ASCII output format, see page 2-174.

_ERR
Outputs the Instrument’s Error Number Information
Syntax _ERR,p1,p2,...
Write the details of the negative response returned from the recorder in p1, p2, etc.
Example
Output the error number 10:1:2,500:2:5
Syntax _ERR,10:1:2,500:2:5
Description
• For the ASCII output format, see page 2-174.

_UNS or _UNR
Outputs the Instrument’s Unit Configuration Information
Syntax _UNS
Outputs the status that is recognized by the device.
_UNS
_outputs the installation status.
Description
• For the ASCII output format, see page 2-175.

_MDS or _MDR
Outputs the Instrument’s Module Configuration Information
Syntax _MDS
Outputs the status that is recognized by the device.
_MDS
_outputs the installation status.
Description
• For the ASCII output format, see page 2-176.
2.9 Responses to Commands

This section explains the responses that recorder returns in response to commands. There are three types of responses: affirmative response, negative response, and data output response.

2.9.1 Affirmative Response (For commands other than output request commands)

If the recorder successfully completes the processing of a received command that is not an output request command, it returns an affirmative response.

Syntax

```
E0CRLF
```

“CRLF” is the terminator that the recorder uses. “CRLF” will be used in the explanation of the syntax. In the response examples, “CRLF” will be omitted.

2.9.2 Negative Response

If a command syntax error, setting error, or other error occurs, the recorder returns a negative response.

Syntax

```
E1,p,p,•••,pCRLF
```

- `p` Error number and the position of error occurrence
- The detailed format of `p` is indicated below. The recorder outputs the error number, the position of the command where the error occurred, and the position of the parameter where the error occurred, each separated by a colon.

  - `en` Error number.
  - `cp` A value indicating the command position where the error occurred. The position is numbered in order with the first command as 1. For a single command, the recorder outputs 1.
  - `pp` A value indicating the parameter position where the error occurred. The position is numbered in order with the first parameter in each command as 1. For errors that pertain to the entire command (for example, error in the command name), the recorder outputs 0.

- If errors occur in multiple parameters, the recorder outputs numbers separated by commas in ascending order.

Response Example 1

If error number 3 occurs in the second parameter of a single command, the recorder outputs:

```
E1,3:1:2
```

Response Example 2

If error number 1 occurs in the third parameter and error number 100 occurs in the fifth parameter of a single command, the recorder outputs:

```
E1,1:3,100:1:5
```
Response Example 3
In a string of two commands, if error number 10 occurs in the second parameter of the first command and error number 500 occurs in the fifth parameter of the second command, the recorder outputs:

E1,10:1:2,500:2:5

Error Messages
You can use the “instrument’s error number information output command” (_ERR) to output the error message that corresponds to an error number of a negative response.

2.9.3 Data Output Response
There are two types of data output: ASCII and binary.

ASCII Output
The responses to the following commands are in ASCII.
• Queries for operation commands and setting commands
• ASCII data output requests of output commands

Syntax

```
EA
ASCII string data • • • • • • • • CRLF
ASCII string data • • • • • • • • CRLF
| ASCII string data • • • • • • • • CRLF
EN
```

The recorder adds a header (EA) in front of the ASCII string output data and a footer (EN) at the end. The recorder adds the two characters CRLF to the end of headers, footers, and ASCII string data.
Binary Output

The responses to output commands consisting of binary data output requests are in binary.

**Format**

The following figure shows the binary output format. The recorder adds a header to the front of binary output data and a checksum at the end. The request data is entered in the data block.

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Flag Value</th>
<th>Flag Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>Always zero</td>
<td>Not used</td>
</tr>
<tr>
<td>14</td>
<td>No</td>
<td>Yes Data sum inclusion</td>
</tr>
<tr>
<td>13</td>
<td>Always zero</td>
<td>Not used</td>
</tr>
<tr>
<td>:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
<td>Intermediate data Last data</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the output data is continuous data, this flag indicates whether the last value in the data block is intermediate data or last data.</td>
</tr>
</tbody>
</table>
```

**Reserved area 1 (16 bits), reserved area 2 to (16 bits)**

Not used

**Header sum (16 bits, big endian)**

The header sum block indicates the sum of "data length + flag + reserved area 1 + reserved area 2."
Data Block
The actual output data. The format varies depending on the output content. For details, see section 2.11, "Format of the Data Block of Binary Output."

Data sum (16 bits, big endian)
The data sum block indicates the sum of the data block. Use the CCheckSum command to specify whether to include data sum. By default, check sum is set to "No." Whether data sum is included is expressed by a flag in the header block. If the data sum block is not included, the area itself will not be included. For the check sum calculation method, see Appendix 5 Check Sum Calculation Method.

2.9.4 Output in Response to RS-422/485 Commands
The table below shows the responses to the ESC O command and ESC C command. ESC in ASCII code is 0x1B. For details, see Appendix 1 ASCII Character Codes.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Meaning</th>
<th>Response</th>
</tr>
</thead>
</table>
| ESC O_xxCRLF (_: Space) | Opens an instrument | • Response from the destination instrument ESC OxxCRLF 
• If there is no instrument at the address specified by the command* 
No response |
| ESC C_xxCRLF (_: Space) | Closes an instrument | • Response from the destination instrument ESC CxxCRLF 
• If there is no instrument at the address specified by the command* 
No response |

* Some possible reasons why the condition "there is no instrument at the address specified by the command" occurs are command error, the address assigned to the instrument is different, the instrument is not turned on, and the instrument is not connected through serial interface.

• "xx" in the table represents the instrument address. You can specify any address within the range of 01 to 99 and within the addresses assigned to the communication target instruments.
• You can only open one instrument at any given time.
• When you open an instrument with the ESC O command, you can send commands to it.
• Use CR+LF for the terminator.
2.10 ASCII Output Format

This section explains the ASCII output format.

- In the following format descriptions, the terminator is denoted by “<crlf>.”
- One space (ASCII code : 0x 20) is denoted by an underscore (_). Consecutive spaces are denoted by alternating underscores (_) and overscores (¯).
- An I/O channel is expressed as a four-digit number (e.g., 0102), a math channel is expressed as “A” followed by a three-digit number (e.g., A015), and a communication channel is expressed as “C” followed by a three-digit number (e.g., C120).

2.10.1 Most Recent Channel Data (FData)

The output in response to the command “FData,0” is shown below.

**Syntax**

EA<crlf>
DATE_yy/mo/dd<crlf>
TIME_hh:mm:ss.mmm<crlf>
s_ccCCca1a2a3a4uuuuuuuuufddddddddE-pp<crlf>
...s_ccccca1a2a3a4uuuuuuuuufddddddddE-pp<crlf>
EN<crlf>

**yy/mo/dd** Data time (year, month, day)
- **yy** Year (00 to 99)
- **mo** Month (01 to 12)
- **dd** Day (01 to 31)

**hh:mm:ss.mmm** Data time (hour, minute, second, millisecond)
- **hh** Hour (00 to 23)
- **mm** Minute (00 to 59)
- **ss** Second (00 to 59)
- **mmm** Millisecond (000 to 999)

A period is inserted between the minute and millisecond.

**t** Reserved (space)

**s** Data status
- **N** Normal
- **D** Differential input
- **S** Skip
- **O** Over
- **E** Errors
- **B** Burnout
- **C** Communication channel error

**cccc** Channel number (I/O channel, math channel, communication channel)

**a1** Alarm status (level 1)
- **a2** Alarm status (level 2)
- **a3** Alarm status (level 3)
- **a4** Alarm status (level 4)

**a1, a2, a3, and a4** is set to one of the following:
- **H** High limit alarm
- **L** Low limit alarm
- **h** Difference high limit alarm
- **l** Difference low limit alarm
- **R** High limit on rate-of-change alarm
- **r** Low limit on rate-of-change alarm
- **T** Delay high limit alarm
- **t** Delay low limit alarm

**Space** No alarm

The alarm statuses of control alarms (when a PID control module is installed) are all set to zero.

**uuuuuuuuuu** Unit (fixed to 10 characters. Output flush left. Unused character positions are filled with spaces.)
2.10 ASCII Output Format

2.10.2 Most Recent (DO Channel) Status (FRelay)

The output in response to the command "FRelay,0" is shown below.

**Syntax**

When no expandable I/O is connected

```
EA<crlf>
M00:aaa…<crlf>
M01:aaa…<crlf>
M02:aaa…<crlf>
M03:aaa…<crlf>
M04:aaa…<crlf>
M05:aaa…<crlf>
M06:aaa…<crlf>
M07:aaa…<crlf>
M08:aaa…<crlf>
M09:aaa…<crlf>
EN<crlf>
```

When an expandable I/O or sub unit is connected

Only the information of detected units will be output.

```
EA<crlf>
Unit:nnf
M00:aaa…<crlf>
M01:aaa…<crlf>
M02:aaa…<crlf>
M03:aaa…<crlf>
M04:aaa…<crlf>
M05:aaa…<crlf>
M06:aaa…<crlf>
M07:aaa…<crlf>

EN

nn  Unit number
f   * Main unit
    (Space) Expandable I/O or subunit
aaa... Outputs the relay (DO channel) status of module numbers 00 to 09.
If the module installed in the corresponding module number is not a DO module, a hyphen is output.
If the module installed in the corresponding module number is a DO module, “1” or “0” is output for the number of channels in the module in ascending order by channel number.
“1” indicates relay (DO channel) ON state, and “0” indicates relay (DO channel) OFF state.
If the DO terminal action (relay action) of a PID control module is set to “Contact output within module,” the DO (relay) status is fixed to OFF.
2.10.3 Internal Switch Status (FRelay)

The output in response to the command “FRelay,1” is shown below.

**Syntax**

```
EA<br>
S001-010:aaaaaaaaaa<br>
S011-020:aaaaaaaaaa<br>
S021-030:aaaaaaaaaa<br>
S031-040:aaaaaaaaaa<br>
S041-050:aaaaaaaaaa<br>
S051-060:aaaaaaaaaa<br>
S061-070:aaaaaaaaaa<br>
S071-080:aaaaaaaaaa<br>
S081-090:aaaaaaaaaa<br>
S091-100:aaaaaaaaaa<br>
EN<br>
```

aaa…a  The most recent internal switch status is output. The internal switch status is output 10 channels per line over 10 lines. “1” indicates that the internal switch is ON, and “0” indicates that the internal switch is OFF.

2.10.4 Latest re-transmission output (AO channel) state (FTransStatAO)

The output in response to the command “FTransStatAO” is shown below.

**Syntax**

**When no expandable I/O is connected**

```
EA<br>
M00:aaa…<br>
M01:aaa…<br>
M02:aaa…<br>
M03:aaa…<br>

M09:aaa...<crlf>
EN<crlf>

nn  Unit number
f   *  Main unit
     (Space) Expandable I/O or sub unit
aaa... Outputs the re-transmission (AO channel) states of module numbers 00 to 09.
If the module installed in the corresponding module number is not an AO module,
a hyphen is output.
If the module installed in the corresponding module number is an AO module, "1" or "0" is output for the number of channels in the module in ascending order by channel number.
"1" indicates re-transmission (AO channel) ON state, and "0" indicates re-transmission (AO channel) OFF state.
If the channel range setting is Skip or manual output, a hyphen is output.
```
2.10.5 Users Who Are Currently Logged In (FUser)

The output in response to the command “FUser,0” is shown below.

Syntax

EA\n
p_l_uuuuuuuuuuuuuuuuuu_abcd...\n
EN\n
Login mode

M  Via general communication
W  Via Web (HTTP server)
F  Via FTP server
S  RS-232, RS-422/485, USB communication, or Bluetooth
D  Via front panel

User level

A  Administrator
U  User
M  Monitor

User name (fixed to 20 characters. Unused character positions are filled with spaces.)

User name

Authority of user

Free
Lock

a through y represent actions. p through y are output only when the advanced security function (/AS) is enabled.

a  Memory
b  Math
c  Data save

2.10.9 Alarm Summary (FLog)

The output in response to the command “FLog,ALARM” is shown below.

Syntax

```
EA<crlf>
yyyy/mo/dd:hh:mm:ss.ttt_kkk_cccc_lss<crlf>
...
EN<crlf>
```

```
yyyy/mo/dd:hh:mm:ss.ttt  Time of alarm occurrence
   yyyy           Year (1900 to 2099)
   mo            Month (01 to 12)
   dd            Day (01 to 31)
   hh            Hour (00 to 23)
   mm            Minute (00 to 59)
   ss            Second (00 to 59)
   ttt           Millisecond (000 to 999)
                 A period is inserted between the minute and millisecond.
   kkk          Alarm cause
       OFF       Alarm release
       ON_       Alarm occurrence
       ACK       All channel alarm ACK, Individual alarm ACK
                   ALL       All channel alarm OFF
   cccc         Channel number (set to four spaces if the alarm cause is
                 “ACK” or “ALL”)  
   l            Alarm level (1 to 4)
   ss           Alarm type
       H_       High limit alarm
       h_       Difference high limit alarm
       L_       Low limit alarm
       l_       Difference low limit alarm
       R_       High limit on rate-of-change alarm
       r_       Low limit on rate-of-change alarm
       T_       Delay high limit alarm
       t_       Delay low limit alarm
```

If the cause of alarm is “all channel alarm ACK” or “all channel alarm OFF,” the channel number, alarm level, and alarm type will be blank.
If the cause of alarm is “individual alarm ACK,” the alarm type will be blank.
2.10.10  Message Summary (FLog)

The output in response to the command “FLog,MSG” is shown below.

Syntax

```
EA\r\nyyyy/mo/dd_hh:mm:ss_YYYY/MO/DD_HH:MM:SS_t_mmm...m_zzz_ggg...g_uuu...u\r\nEN\r
```

- **EA**: Time when the message was written
  - `yyyy` Year (1900 to 2099)
  - `mo` Month (01 to 12)
  - `dd` Day (01 to 31)
  - `hh` Hour (00 to 23)
  - `mm` Minute (00 to 59)
  - `ss` Second (00 to 59)
- **EN**: Data position where message was written
  - `YYYY` Year (1900 to 2099)
  - `MO` Month (01 to 12)
  - `DD` Day (01 to 31)
  - `HH` Hour (00 to 23)
  - `MM` Minute (00 to 59)
  - `SS` Second (00 to 59)
- **t**: Message type
  - `N`: Normal message
  - `H`: Freehand message
- **mmm...m**: Message (fixed to 48 characters. Unused character positions are filled with spaces.)
  For freehand message, the string “(image)” is output.
- **zzz**: Operation property (3 characters)
  - `KEY`: Touchscreen operation, key operation
  - `REM`: Remote
  - `COM`: Ethernet communication
  - `SER`: Serial communication (RS-232, RS-422/485, USB communication, or Bluetooth)
  - `ACT`: Event action
  - `SYS`: System
  - `EXT`: Operation from an external device (e.g. Modbus)
  - `WEB`: Operation from web pages (GM, only when the advanced security function (/AS) is enabled)
- **ggg...g**: Target group (multiple groups are expressed using dot delimiters) (fixed to 16 characters. Unused character positions are filled with spaces.)
  - `ALL`: All display groups
  - `aa.bb.cc.dd...`: Multiple display groups
- **uuu...u**: User name (fixed to 20 characters. Unused character positions are filled with spaces.)
2.10.11 Event log (FLog)

The output in response to the command “FLog EVENT” is shown below.

**Syntax**

```
EA\r\nyyyy/mo/dd hh:mm:ss_zzz_uuu\r\n\r
EN\r
```

```
yyyy/mo/dd hh:mm:ss
```

Time of event occurrence

- **yyyy**: Year (1900 to 2099)
- **mo**: Month (01 to 12)
- **dd**: Day (01 to 31)
- **hh**: Hour (00 to 23)
- **mm**: Minute (00 to 59)
- **ss**: Second (00 to 59)

- **zzz**: Event cause
  - **KEY**: Touchscreen operation, key operation
  - **REM**: Remote
  - **COM**: Ethernet communication
  - **SER**: Serial communication (RS-232, RS-422/485, USB communication, or Bluetooth)
  - **ACT**: Event action
  - **SYS**: System
  - **EXT**: Operation from an external device (e.g. Modbus)
  - **WEB**: Operation from web pages (GM, only when the advanced security function (/AS) is enabled)

- **sss...s**: Event string (fixed to 16 characters. Unused character positions are filled with spaces.)

- **uuu...u**: User name (fixed to 20 characters. Unused character positions are filled with spaces.)

See section “2.10.23 Detail Event Log Output (FEventLog) (/AS)”.

2.10.12 Error Log (FLog)

The output in response to the command “FLog ERROR” is shown below.

**Syntax**

```
EA\r\nyyyy/mo/dd hh:mm:ss_nnn_uuu\r\n\r
EN\r
```

```
yyyy/mo/dd hh:mm:ss
```

Time of error occurrence

- **yyyy**: Year (1900 to 2099)
- **mo**: Month (01 to 12)
- **dd**: Day (01 to 31)
- **hh**: Hour (00 to 23)
- **mm**: Minute (00 to 59)
- **ss**: Second (00 to 59)

- **nnn**: Error code (001 to 999)
- **uuu...u**: Error message (fixed to 80 characters. Unused character positions are filled with spaces.)

2.10.13 Address Setting Log (FLog)

The output in response to the command “FLog,DHCP” is shown below.

Syntax

```
EA<crlf>
yyyy/mo/dd:hh:mm:ss_kkk...k_mmm...m<crlf>
--
EN<crlf>
```

```
yyyy/mo/dd:hh:mm:ss  Time of occurrence
  yyyy  Year (1900 to 2099)
  mo    Month (01 to 12)
  dd    Day (01 to 31)
  hh    Hour (00 to 23)
  mm    Minute (00 to 59)
  ss    Second (00 to 59)

kkk...k  Type (fixed to 15 characters. Unused character positions are filled with spaces. See table below.)

mmm...m  Message (fixed to 20 characters. Unused character positions are filled with spaces. See table below.)
```

* If the recorder cannot accept the IP address obtained from the DHCP server, the recorder will reject the address and immediately return a response to the DHCP server.
General Communication Log (FLog)

The output in response to the command “FLog,General” is shown below.

**Syntax**

```
EA<br>
yyyy/mo/dd_hh:mm:ss_nn_uuu...u_fdmmm_m<br>
...
EN<br>
```

```
yyyy/mo/dd_hh:mm:ss Time of command Tx/Rx

yyyy Year (1900 to 2099)
mo Month (01 to 12)
dd Day (01 to 31)
hh Hour (00 to 23)
mm Minute (00 to 59)
ss Second (00 to 59)

nn Connection ID
s0 Serial (general)
s1 Bluetooth connection
s2 USB connection
e0 Ethernet connection #0 (general)
e1 Ethernet connection #1 (general)
e2 Ethernet connection #2 (general)
e3 Ethernet connection #3 (general)

uuu...u User name (fixed to 20 characters. Unused character positions are filled with spaces.)

f Multiple command flag
* Single command
* Multiple commands

d Tx/Rx
> Tx (command: connected instrument to recorder)
< Rx (Response: recorder to connected instrument)

mmm...m Message (fixed to 40 characters. Unused character positions are filled with spaces.)
The recorder normally outputs the data that has been transmitted or received as-is, but it sometimes outputs special messages. Special messages are shown below.

(output) Data output
(Over length) Command length too long
(time out) Timeout
(disconnected) Disconnection (occurs when an Ethernet connection is disconnected)
## 2.10.15 Modbus Communication Log (FLog)

The output in response to the command "FLog, Modbus" is shown below.

### Syntax

```
EA\crlf
yyyy/mo/dd:mm:ss_c_xxxxxx_kkk...k_nnn_d\crlf...
EN\crlf
```

- **yyyy/mo/dd:mm:ss** Time of error occurrence
  - *yyyy* Year (1900 to 2099)
  - *mo* Month (01 to 12)
  - *dd* Day (01 to 31)
  - *hh* Hour (00 to 23)
  - *mm* Minute (00 to 59)
  - *ss* Second (00 to 59)

- **c** Communication type
  - *M* Modbus master
  - *C* Modbus client

- **xxxxxx** Event that occurred (fixed to 6 characters)
  - *ACTIVE* Activated
  - *READY_* Command ready state
  - *CLOSE_* Disconnected
  - *HALT_* Command halted
  - *_*_*_*_* Other than those above

- **kkk...k** Details (fixed to 15 characters. Unused character positions are filled with spaces. See table below.)

- **nnn** Command number (0 to 999)

- **d** Command type
  - *R* Read
  - *W* Write
  - *O* Write immediately (write from the custom display)
  - *N* Miscellaneous

### 2.10.16 FTP Client Log (FLog)

The output in response to the command “FLog,FTP” is shown below.

#### Syntax

```
EA<br>
yyyy/mm/dd hh:mm:ss xxxxxxxxxx_k_fff...f<br>
EN<br>

yyyy/mm/dd hh:mm:ss Time of error occurrence
```

**Detailed code (fixed to 9 characters)**

- **TCP/IP** = Internal processing error
- **HOSTADDR** = IP address not set
- **HOSTNAME** = Unable to resolve server host name
- **UNREACH** = Unable to connect to server
- **CONNECT** = Unable to connect to data port
- **SEND** = Transmission to data port failed
- **RECV** = Reception from data port failed
- **REPLY** = Received reject response from server
- **SERVER** = Invalid server response
- **CMDSEND** = Error in sending command to control port
- **CMDRECV** = Error in receiving command from control port
- **USER** = Invalid user name
- **PASS** = Invalid password
- **ACCT** = Internal processing error
- **TIMEOUT** = Response timeout
- **LINK** = Ethernet cable not connected
- **FILE** = File access failed
- **NOFD** = Internal processing error
- **NOID** = Internal processing error
- **PARAM** = Internal processing error
- **CERT** = Certificate verification error
- **SSL** = Encryption communication error

- **k** = Server type (P, S)
- **fff...f** = File name (fixed to 51 characters including extension. Unused character positions are filled with spaces.)
### 2.10.17 SNTP (Time Adjustment) Client Log (FLog)

The output in response to the command "FLog,SNTP" is shown below.

**Syntax**

```
EA\r\nyyy/mo/dd_hh:mm:ss_nnn_xxxxxxxxx\r\n...
EN\r
```

```
yyyy/mo/dd_hh:mm:ss  Time of error occurrence
  yyyy              Year (1900 to 2099)
  mo                Month (01 to 12)
  dd                Day (01 to 31)
  hh                Hour (00 to 23)
  mm                Minute (00 to 59)
  ss                Second (00 to 59)

nnn  Error code

xxxxxxxxxx  Detailed code (fixed to 9 characters)
  SUCCESS|-- Success
  EOVER|-- Adjustment limit exceeded
  EDORMANT-- Internal processing error
  EHOSTNAME-- Host name lookup failed
  ETCPIP-- Internal processing error
  ESEND-- Packet transmission failed
  ETIMEDOUT-- Response timeout occurred
  EBROKEN-- Response packet corrupt
  ERECV-- Reception error
  EINVALI-- Internal processing error
  ENOID-- Internal processing error
```
2.10 ASCII Output Format

2.10.18 E-Mail Client Log (FLog)

The output in response to the command “FLog,MAIL” is shown below.

Syntax

EA<crlf>
yyyy/mo/dd:hh:mm:ss_ffffff_eeeeeeeeeee_n_uuu<u<crlf>
EN<crlf>

yyyy/mo/dd:hh:mm:ss  Time of transmission
  yyyy       Year (1900 to 2099)
  mo         Month (01 to 12)
  dd         Day (01 to 31)
  hh         Hour (00 to 23)
  mm         Minute (00 to 59)
  ss         Second (00 to 59)

ffffff  Cause (fixed to 6 characters)
  ALARM_     Alarm mail
  TIMER_     Scheduled mail
  POWER_     Power-on, power failure recovery
  Memory     Low external storage memory
  ERROR_     Error notification
  REPORT     Report file
  TEST_      Test mail
  PASSWD     User lock out

eeeeeeeeee  Detailed error code (fixed to 12 characters)
  HOSTADDR_  IP address not set
  HOSTNAME_  Unable to resolve server host name
  TIMEOUT_   Communication with server timed out
  LINK_      Ethernet cable not connected
  UNREACH_   Unable to connect to server
  HELO_      Server rejected greeting message
  MAILFROM_  Server rejected sender
  RCPTTO_    Server rejected recipient
  DATA_      Server rejected the data transmission command
  TCPIP_     Internal processing error
  INVAL_     Internal processing error
  SMTPAUTH_  SMTP AUTH authentication failed
  ANOTSUPPORT_  Unsupported authentication method
  POP3UNREACH_  Unable to connect to POP3 server
  POP3TIMEOUT_  POP3 server connection timed out
  POP3HOSTNAME_  Unable to resolve POP3 host name
  POP3AUTH_   POP3 server authentication failed
  CERT_      Certificate verification error
  SSL_       Encryption communication error

n  recipient
  1  Recipient 1
  2  Recipient 2
  +  Recipient 1+2

uuu...u  Recipient mail address (fixed to 30 characters. Unused character positions are filled with spaces.)
The user name section of the recipient mail address (the “XXXX” section of “XXXX@abc.def.ghi”) is output.
2.10.19 Web Log (FLog)

The output in response to the command “FLog,WEB” is shown below.

Syntax

```crtf
EA<crlf>
yyyy/mo/dd_hh:mm:ss xxx.xxx.xxx mmmmmmmm_uuu...u ccc_nnn..<crlf>
EN<crlf>
```

```
yyyy/mo/dd_hh:mm:ss Time of error occurrence

2.10.21 Control Alarm Summary (FLog)
The output in response to the command “FLog,CALARM” is shown below.

Syntax
EA\crlf>
yyyy/mo/dd:hh:mm:ss,kkkcccc_lsssss\crlf>
EN\crlf>

yyyy/mo/dd:hh:mm:ss,ttt Time of control alarm occurrence
yyyy Year (1900 to 2099)
mo Month (01 to 12)
hh Hour (00 to 23)
mm Minute (00 to 59)
ss Second (00 to 59)
ttt Millisecond (000 to 999)
A period is inserted between the minute and millisecond.

kkk Alarm cause
OFF Alarm release
ON_ Alarm occurrence
ACK All channel alarm ACK, individual alarm
ACK

cccc Loop number (L001 to L692)
l Alarm level (1 to 4)

sssss Alarm type
PVH_ PV high limit
PVL_ PV low limit
SPH_ SP high limit
SPL_ SP low limit
DVH_ Deviation high limit
DVL_ Deviation low limit
DVO_ Deviation H/L limits
DVI_ Deviation within H/L limits
OTH_ Control output high limit
OTL_ Control output low limit
PVR_ PV velocity

If the cause of alarm is “all channel alarm ACK” or “all channel alarm OFF,” the loop number, alarm level, and alarm type will be blank.
If the cause of alarm is “individual alarm ACK,” the loop number and alarm level will be output.
2.10 ASCII Output Format

### 2.10.22 Control Summary (FLog)

### 2.10.23 Detail Event Log Output (FEventLog) (/AS)

The output in response to the command "FEventLog" is shown below. Output is possible when the advanced security function (/AS) is enabled. Output from Web operation is possible only when the GM’s advanced security function (/AS) is enabled.

#### Syntax

```
EA\r\nyyyy/mo/dd:hh:mm:ss_zzz_sss...s_uuu...u_ddd...\r\nEN\r
```

- **yyyy/mo/dd:hh:mm:ss**  
  - *sss...s*  
    - Time of event occurrence  
      - **yyyy** Year (1900 to 2099)  
      - **mo** Month (01 to 12)  
      - **dd** Day (01 to 31)  
      - **hh** Hour (00 to 23)  
      - **mm** Minute (00 to 59)  
      - **ss** Second (00 to 59)  
    - *zzz* Event cause  
      - **KEY** Touchscreen operation, key operation  
      - **REM** Remote  
      - **COM** Ethernet communication  
      - **SER** Serial communication (RS-232, RS-422/485, USB communication, or Bluetooth)  
      - **ACT** Event action  
      - **SYS** System  
      - **EXT** Operation from an external device (e.g. Modbus)  
      - **WEB** Operation from web pages (GM, only when the advanced security function (/AS) is enabled)  
  - *sss...s* Event string (fixed to 16 characters. Unused character positions are filled with spaces. See the table below.)  
  - *uuu...u* User name (fixed to 20 characters. Unused character positions are filled with spaces.)  
  - *ddd...* Detailed information (see table below)

#### Event string, detailed information

Operations that are marked with an asterisk will be logged regardless of whether the advanced security function is enabled or disabled.

All other operations are logged only when the advanced security function (/AS) is enabled.

<table>

2.10.24  External Storage Medium and Internal Memory File List (FMedia)

The output in response to the command “FMedia,DIR” is shown below.

Syntax
EA<crlf>
yy/mm/dd hh:mm:ss lll...l fff...<crlf>
yy/mm/dd hh:mm:ss <DIR>_dddddddd...<crlf>
EN<crlf>

yyyy/mo/dd hh:mm:ss  Time of file generation
  yy  Year (1900 to 2099)
  mm  Month (01 to 12)
  dd  Day (01 to 31)
  hh  Hour (00 to 23)
  mi  Minute (00 to 59)
  ss  Second (00 to 59)
 lll...l  File size (fixed to 10 characters. Unused character positions are filled with spaces.)
          For directories, <DIR> is output.
 fff...  File name

2.10.25  External Storage Medium Free Space (FMedia)

The output in response to the command “FMedia,CHKDSK” is shown below.

Syntax
EA<crlf>
zzzzzzzz_Kbytes_free<crlf>
EN<crlf>

zzzzzzz  Free space (KB)
2.10.26 Setting Data (FCnf)

The output in response to the command “FCnf” is shown below.

**Syntax**

```plaintext
EA<crlf>
<Response to a setting query>
EN<crlf>
```

The setting data is output in the format of the response to a setting query.

2.10.27 Decimal Place and Unit Information (FChInfo)

The output in response to the command “FChInfo” is shown below.

**Syntax**

```plaintext
EA<crlf>
s_cccc_uuuuuuuuuu,pp<crlf>
s_cccc_uuuuuuuuuu,pp<crlf>
s_cccc_uuuuuuuuuu,pp<crlf>
EN<crlf>
```

- **s** Data status
  - N Normal
  - D Differential input
  - S Skip

- **cccc** Channel number (I/O channel, math channel, communication channel)

- **uuuuuuuuuu** Unit information (fixed to 10 characters. Unused character positions are filled with spaces.)

- **pp** Decima place (00 to 05)

- The decimal place of the mantissa on channels set to LOG scale (/LG)
2.10.28 System Configuration (FSysConf)

The output in response to the command “FSysConf” is shown below.

Syntax

When no expandable I/O is connected

```
EA<crlf>
Unit:00
00:cccccccccccccccc_uuuuuuuuuuuuuuuu_defghijklmnopqrs<crlf>
01:cccccccccccccccc_uuuuuuuuuuuuuuuu_defghijklmnopqrs<crlf>

nn  Unit number

```
2.10.29 Bluetooth Device Information (FBTDevInfo)

The output in response to the command "FBTDevInfo" is shown below.

Syntax

```
EA<crlf>
(BD address),(module information)<crlf>
EN<crlf>
```

(module information) xxxx (user-defined character string)

Before the Bluetooth function is turned on after power-on, the xx of the BD address area will be spaces, and the module information area will be empty (no characters).

Output Example

When p1 is omitted

```
EA<crlf>
B4:17:D3:AC:07:AA,Init R02.01.1(build 000)<crlf>
EN<crlf>
```
2.10.30  Reminder Information Output (FReminder)
The output in response to the command “FReminder” is shown below.

Syntax
EA\crlf
nn ssssss yyy/mo/dd_YYY/MO/DD_e...\crlf
EN\crlf

nn
Schedule number (01 to 12)
ssssss
Status
None
Normal
Notice
Expire
yyyy/mo/dd
YYYY/MO/DD
e...
Previous set date
Expiration date

If the status is None, the subsequent information is not output.

Output Example
EA
01_None
02_Normal_2015/02/28_2015/03/30_30
03_Notice_2015/02/25_2015/02/28_3

12_None
EN
2.10 ASCII Output Format

2.10.31 Outputs the Most Recent Control Data (FCtrlData)

The output in response to the command "FCtrlData" is shown below. Outputs the most recent control data per loop.

Syntax
EA<crlf>
DATE_yy/mo/dd<crlf>
TIME_hh:mm:ss.mmmt<crlf>
llll,S_fddddddddE-pp,S_fddddddddE-pp,S_fddddddddE-pp,aaaa1aaaa2aaaa3aaaa4<crlf>
EN<crlf>

yy/mo/dd Data time (year, month, day)
  yy Year (00 to 99)
  mo Month (01 to 12)
  dd Day (01 to 31)

hh:mm:ss.mmmt Data time (hour, minute, second, millisecond)
  hh Hour (00 to 23)
  mm Minute (00 to 59)
  ss Second (00 to 59)
  mmm Millisecond (000 to 999)

A period is inserted between the minute and millisecond.
t Reserved (space)
llll Loop number
s Data status
  N Normal
  S Skip
  O Over
  E Errors
  B Burnout
  F No data
  M Luck of data/Module not installed
f Sign (+ or -)

dddddddd Mantissa (00000000 to 99999999; 8 digits)
If the data status is O (±over) or B (burnout), the mantissa will be the value of -5% to 105% of the range.
If the data status is E, the mantissa is 99999999.

pp Exponent (00 to 04)

aaaa1aaaa2aaaa3aaaa4 Alarm Status
aaaa1 Alarm status 1
aaaa2 Alarm status 2
aaaa3 Alarm status 3
aaaa4 Alarm status 4
aaaa1, aaaa2, aaaa3, or aaaa4 is set to one of the following:
  PVH PV high limit
  PVL PV low limit
  SPH SP high limit
  SPL SP low limit
  DVH Deviation high limit
  DVL Deviation low limit
  DVO Deviation H/L limits
  DVI Deviation within H/L limits
  OTH Control output high limit
  OTL Control output low limit
  PVR PV velocity
If an alarm has not occurred, the alarm status is set to space.

s_fddddddddE-pp is in order of PV, SP, and OUT.
The data time outputted is not the time of a control period but the data acquisition time by a communication command.
2.10.32  SP Number and PID Number Output (FCtrlNo.)

The output in response to the command “FCtrlNo” is shown below.

Syntax
EA<crlf>
LOOPLllll<crlf>
SPNO,x<crlf>
PIDNO,y<crlf>
EN<crlf>

llll                        Loop number (L001 to L692)
x                             SP number (1 to 8)
y                         PID number (1 to 8, R)

Output Example
FCtrlNo,L001
EA
LOOPL001<crlf>
SPNO,1<crlf>
PIDNO,2<crlf>
EN
2.10  ASCII Output Format

2.10.33  Control Mode Output (FCtrlMode)

The output in response to the command “FCtrlMode” is shown below.

Syntax

EA<crlf>
llll,xxx.xxx.xxx.xxx<crlf>
EN<crlf>

llll  Loop number (L001 to L692)

xxx  The states of bits 31 to 24, 23 to 16, 15 to 8, and 7 to 0 are indicated in order using decimal notation.

Bit 0
0  RUN
1  STOP

Bit 1
0  LOCAL
1  REMOTE

Bit 2
Bit 3
0  AUTO
1  MANUAL
2  CASCADE

Bit 4
0  Auto-tuning off
1  Auto-tuning on

Bits 5 to 7
Not used

Bit 8
0  AI1 not used
1  AI1 used

Bit 9
0  AI2 not used
1  AI2 used

Bit 10
0  EXPV1 not used
1  EXPV1 used

Bit 11
0  EXPV2 not used
1  EXPV2 used

Bits 12 to 28
Not used

Bits 29 and 30
0  PROG
1  RESET
2  LOCAL

Bit 31
0  Program operation not available
1  Program operation available

Output Example

When program operation is in progress, auto-tuning is in progress, cascade operation is in progress, and when in PROG, REMOTE, and RUN states

EA<crlf>
L001,128.000.000.026<crlf>
EN<crlf>
2.10.34 Program Operation Mode Output (FPrgMode)

The output in response to the command "FPrgMode" is shown below.

**Syntax**

```
EA\<crlf>
pp,xxx.xxx.xxx.xxx\<crlf>
EN\<crlf>
```

**PP**  Program pattern number (1 to 99)

**xxx**  The states of bits 31 to 24, 23 to 16, 15 to 8, and 7 to 0 are indicated in order using decimal notation.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Program stopped</td>
</tr>
<tr>
<td>1</td>
<td>Program running</td>
</tr>
<tr>
<td>0</td>
<td>Not holding</td>
</tr>
<tr>
<td>1</td>
<td>Holding</td>
</tr>
<tr>
<td>0</td>
<td>Not waiting</td>
</tr>
<tr>
<td>1</td>
<td>Waiting</td>
</tr>
</tbody>
</table>

**Bits 3 to 31**  Not used

**Output Example**

When not waiting, not holding, and program is running

```
EA\<crlf>
01,000.000.000.001\<crlf>
EN\<crlf>
```
2.10 ASCII Output Format

2.10.35 Program Pattern Information Output (FPrgPtnInfo)

The output in response to the command "FPrgPtnInfo" is shown below.

Syntax

EA
PTNNO,a

Output Example

FPrgEvent,1
When PV event 1 and time events 2 and 3 are occurring
EA<crlf>
01,000.000.000.001<crlf>
01,000.000.000.006<crlf>
EN<crlf>
2.10.37 Program control end signal status output (FPrgEnd)

The output in response to the command "FPrgEnd" is shown below.

Syntax

```
EA\r\npp,x\r\nEN\r
```

PP  Program pattern number (1 to 99)

x  Program control end signal status

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>5-second program control end signal is off</td>
</tr>
<tr>
<td>1</td>
<td>5-second program control end signal is on</td>
</tr>
</tbody>
</table>

Output Example

```
FPrgEnd,1
EA\r
01,1\r
EN\r
```

When the 5-second program control end signal is on

2.10.38 Currently Running Program Pattern Number and Status Output (FPrgPtnCur)

The output in response to the command "FPrgPtnCur" is shown below.

Syntax

```
EA\r
pp,xxx.xxx.xxx.xxx\r
oo,cccc \n... \n oo,ccc \n EN\r
```

pp  Program pattern number (1 to 99)

xxx The states of bits 31 to 24, 23 to 16, 15 to 8, and 7 to 0 are indicated in order using decimal notation.

<table>
<thead>
<tr>
<th>Bit 0</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Program stopped</td>
</tr>
<tr>
<td>1</td>
<td>Program running</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bit 1</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Not holding</td>
</tr>
<tr>
<td>1</td>
<td>Holding</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bit 2</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Not waiting</td>
</tr>
<tr>
<td>1</td>
<td>Waiting</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bits 3 to 31</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Not used</td>
</tr>
</tbody>
</table>

oo  Number (1 to 20)

cccc Loop number (L001 to L692)

Output Example

Program pattern 1, not holding, not waiting, program running, loop1 and loop2 assignment

```
EA\r
01,000.000.000.001\r
01,L001\n02,L011\nEN\r
```
2.10.39 Instrument Manufacturer (_MFG)

The output in response to the command "_MFG" is shown below. Outputs the instrument manufacturer.

Output Example
EA\nYOKOGAWA\nEN

2.10.40 Instrument's Product Name (_INF)

The output in response to the command "_INF" is shown below.

Output Example
EA\n'GX20/GP20',123456789,xx-xx-xx-xx-xx-xx,Rx.xx.xx\nEN

'GX20/GP20'  Product name ('GX20/GP20', 'GX10/GP10', or 'GM10')
123456789  Product serial number
xx-xx-xx-xx-xx-xx  MAC address (xx's are hexadecimals)
Rx.xx.xx  Firmware version
2.10.41 Instrument's Basic Specifications (_COD)

The output in response to the command "_COD" is shown below.

**Output Example**

```
EA<crlf>
'GX20',-1,J,1,M <crlf>
EN<crlf>

'GX20'  Model
-1  Type
      -1  100 channels
      -2  500 channels
J  Display language
   J  Japanese
   E  English
   C  Chinese
1  Supply voltage
   Blank  (when the product name is GX10, GX20, or GM10)
   1  100 VAC, 240 VAC (when the product name is GP10 or GP20)
M  Power cord
   Blank  (when the product name is GX10, GX20, or GM10)
   M  PSE cable
   D  UL/CSA cable
   F  VDE cable
   R  AS cable
   Q  BS cable
   H  GB cable
   N  NBR cable
```

2.10.42 Instrument’s Firmware Version Information (_VER)

The output in response to the command "_VER" is shown below.

**Output Example**

```
EA<crlf>
B999999,Rx.xx.xx,'Main Program'<crlf>
B999999,Rx.xx.xx, 'Web Program'<crlf>
EN<crlf>

B999999  Firmware part number (first line), Web program part number (second line)
Rx.xx.xx  Firmware version (first line), Web program version (second line)
```
2.10.43 Instrument's Option Installation Information (_,OPT)

The output in response to the command "_,OPT" is shown below.

</tr>
</tbody>
</table>
2.11 Format of the Data Block of Binary Output

Additional Information (64 bits)
Bit 0: Daylight saving time (0: standard time; 1: daylight saving time)

Data Type (4 bits)
Indicates the data type. (1: 32 bit signed integer (big endian); 2: 32 bit floating point)
Data values for channels set to Log scale (/LG) are 32-bit floating-point type.
The alarm statuses of control alarms (when a PID control module is installed) are all set to zero.

Channel Type (4 bits)
Indicates the channel type.

<table>
<thead>
<tr>
<th>Value</th>
<th>Channel Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>I/O channel</td>
</tr>
<tr>
<td>2</td>
<td>Math channel</td>
</tr>
<tr>
<td>3</td>
<td>Communication channel</td>
</tr>
</tbody>
</table>

Status (8 bits)
Indicates the channel status.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
<th>Channel Status</th>

2.11.2  Channel FIFO Data (FFifoCur)

The output in response to the command “FFifoCur,0” is shown below. Outputs the I/O channel, math channel, and communication channel FIFO data.

**Configuration**

Data is stored in “Block 1” shown below.

<table>
<thead>
<tr>
<th>Number of blocks</th>
<th>Number of bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block 1</td>
<td>2 bytes</td>
</tr>
<tr>
<td>Block 2</td>
<td>2 bytes</td>
</tr>
<tr>
<td>Block N-1</td>
<td></td>
</tr>
<tr>
<td>Block N</td>
<td></td>
</tr>
</tbody>
</table>

**Number of Blocks (16 bits)**

Number of stored blocks. Stores the number of blocks that can be output within the range specified by the read start position and end position.

**Number of Bytes (16 bits)**

Stores the number of bytes per block.

**Block**

The content of the block is the same as that of “Block 1” described in section “2.11.1 Most Recent Channel Data (FData)”.

2.11.3  FIFO Data Read Range (FFifoCur)

The output in response to the command “FFifoCur,1” is shown below. Outputs FIFO data read position information.

<table>
<thead>
<tr>
<th>8 bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional information (always 0)</td>
</tr>
<tr>
<td>The read position of the oldest data in the FIFO (1 to 99999999999)</td>
</tr>
<tr>
<td>The read position of the most recent data in the FIFO (1 to 99999999999)</td>
</tr>
</tbody>
</table>

**The read position of the oldest data in the FIFO**

This is the oldest data number within the readable data range.

**The read position of the most recent data in the FIFO**

This is the most recent data number within the readable data range.
### 2.11.4 The Most Recent Control Data (FCtrlData)

The output in response to the command "FCtrlData,1" is shown below. Outputs the most recent control data per loop.

The figure below shows the structure of the output data. Data is stored in “Block 1.”

<table>
<thead>
<tr>
<th>Number of blocks</th>
<th>Number of bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 bytes</td>

<td>1 An alarm is activated.</td>
</tr>
<tr>
<td>7</td>
<td>0 Alarm nonhold state</td>
</tr>
<tr>
<td></td>
<td>1 Alarm hold state</td>
</tr>
</tbody>
</table>

### R/S (8 bits)
Indicates the RUN or STOP of the control operation.
0: RUN, 1: STOP

### A/M/C (8 bits)
Indicates the AUTO, MANUAL or CASCADE of the control operation.
0: AUTO, 1: MANUAL, 2: CASCADE

### L/R (8 bits)
Indicates the LOCAL or REMOTE of the control operation.
0: LOCAL, 1: REMOTE

### R/P/L (8 bits)
Indicates the RESET, PROGRAM or LOCAL of the control operation.
0: RESET, 1: PROG, 2: LOCAL

### AT (8 bits)
Indicates the On or Off of the Auto tuning.
0: OFF, 1: ON

### SPN (8 bits)
1 to 8: SP group number

### PIDN (8 bits)
1 to 8: PID group number, 9: Reference PID
PVSEL (8 bits)
Indicates the status of PV input.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>ON</td>
<td>AI1 is used for PV1.</td>

<tr>
<td>4</td>
<td>ON</td>
<td>AI2 is used for PV1 (when PV switching is selected.)</td>
</tr>
<tr>
<td>5</td>
<td>ON</td>
<td>EXPV2 is used for PV1 (when PV switching is selected.)</td>
</tr>
</tbody>
</table>

PV (32 bits)
Indicates the PV value using an integer.
When the data status is Over or Burnout, the integer will be the value of -5% to 105% of the range.

SP (32 bits)
Indicates the SP value using an integer.
When the data status is Over or Burnout, the integer will be the value of -5% to 105% of the range.

OUT (32 bits)
Indicates the OUT value using an integer.
However, when the Tight shut function is used, the SD is -S1 and Invalid data is -100.
Appendix

Appendix 1 ASCII Character Codes

<td></td>
<td>The characters other than those in blue cells can be used.</td>
</tr>
</tbody>
</table>
Appendix 2 Login Procedure

To communicate using the general communication feature, you must log in to the recorder from your PC. If you complete the procedure successfully up to “Login complete” in the following figure, you will be able to use the commands.

When Using the Login Function

For Bluetooth, the Bluetooth connection flow chart is inserted here (see appendix 7).

* “E1,402” is returned when the advanced security function (/AS) is enabled.
** E251. If the format of the CLogin command is not correct, verification is not performed, and an error code indicating the error is returned. The following error code is returned when the advanced security function (/AS) is enabled.

251, 262, 263, 264, 265, 272, 273, 767

When the password management is in use, the following error code is returned in addition to the error code above.

004,252,261,651,657,760,761,762,763,764,765,766,768,769,770,771,772,773,774,775
When Not Using the Login Function

For Bluetooth, the Bluetooth connection flow chart is inserted here (see appendix 7).

1. When not using the login function, a prompt appears asking if the number of connections is within the limit.
2. If the response is no, the connection is terminated, and the system returns to the login screen.
3. If the system receives an error code (E1, 732), it indicates an issue with the Bluetooth connection, and the connection is terminated.
4. If the code is E1, 401, the system interprets it as a response from the recorder (message omitted).
5. The system may provide a code to respond to the recorder (message omitted).

Appendix 2  Login Procedure
Appendix 3  Output Flow Chart of External Storage Medium Files and File Lists

Example for Outputting File aaaa.dtd
The flow chart for outputting file aaaa.dtd in the DATA0 directory on the external storage medium is shown below.

START

Send command

FMedia,GET,/DRV0/DATA0/aaaa.dtd,0,-1

Receive response

Is there more data?
(1)

Obtain the number of received bytes.
(2)

Compute the unread position.
(3)

Send command

FMedia,GET,/DRV0/DATA0/aaaa.dtd,[unread position],-1

Receive response

(1) If the binary header flag (bit 0) is 0, there is more data. If it is 1, data transmission is complete.

(2) From the data length of the binary output common header, obtain the number of received bytes.

(3) Sum the number of received bytes, compute the unread position.
Example for Outputting a File List

The flow chart for outputting the list of files in the DATA0 directory on the external storage medium is shown below.

START

Send command

FMedia, DIR, /DRV0/DATA0/, 0, -1

Receive response

Are there more file lists?
(1)

Obtain the number of received files
(2)

Compute the unread position.
(3)

End

(1) If there are no more files, EA[crlf]EN[crlf] is output.

(2) Count the number of lines in the output file list.

(3) Sum the number of lines in the file lists to compute the unread position.
Overview of the FIFO Buffer

The recorder internal memory is equipped with a dedicated FIFO (First-In-First-Out) buffer for outputting measured data. Measured data is written to the buffer at every scan interval. The PC can continuously retrieve the most recent measured data from the FIFO buffer. The size of the internal memory allocated for the FIFO buffer varies depending on the model. The number of data entries that the FIFO buffer can store varies depending on the number of channels and scan interval. The number of data entries that the FIFO buffer can store and the data length can be determined with the following formula.

\[
\text{Data entries} = \frac{2000000}{16 + (12 \times \text{number of channels})} \quad \text{(fractions truncated)}
\]

\[
\text{Data length} = \text{[data entries]} \times \text{[scan interval]}
\]

Example: If there are 10 I/O channels, 10 math channels, and 10 communication channels, and the scan interval is 100 ms, the number data entries will be 5319, and the data length will be 531.9 seconds or 8.865 minutes.

Example of FIFO Buffer Operation

The following example shows the case when the scan interval is 1 second and the FIFO internal memory size is for 8 scan intervals.

Writing of Measured Data in the FIFO Buffer

Writing to the FIFO buffer takes place every scan interval. If measured data is written to block 8, the most recent value will be written to block 1 in the next scan interval, overwriting the old value. This is called FIFO wraparound.

On the other hand, the most recent write position is managed using serial numbers starting with 1. The serial number does not return to 1 even when a FIFO wraparound occurs.

Reading Measured Data

The FFifoCur,0 command is used to read measured data. The read start position and read end position are specified using serial numbers. You can use the FFifoCur,1 command to read the serial numbers for the positions that data can be read from.
Appendix 5  Check Sum Calculation Method

The check sum of binary data is calculated using an algorithm like the one shown below.

```c
int CalcSum(unsigned char *buf, int len)
{
    int  odd;
    unsigned long sum;
    unsigned char  *p;

    sum = 0;
    odd = len & 1;
    len >>= 1;

    for (p = buf ; len ; len --, p += 2)
    {
        sum += (*p << 8) | *(p + 1);
    }
    if (odd) sum += (*p << 8);

    sum = (sum & 0xffff) + ((sum >> 16) & 0xffff);
    if (sum > 0xffff) sum = sum - 0xffff;

    return ((~sum) & 0xffff);
}
```
Appendix 6 Data Group Name and Data Name for WT Communication

The table below shows the parameters p5 (Data Group Name) and p6 (Data Name) for SWattData Command.

### Parameters p5 (Data Group Name) and p6 (Data Name) for SWattData Command

Appendix 7 Bluetooth Communication Connection Flow Chart

To compose the complete Bluetooth communication connection flow chart, in appendix 2, insert the following flow chart after “Connect” in the flow chart shown under “When Using the Login Function” when the communication login function is in use or “When Not Using the Login Function” when the function is not in use.

1. A Bluetooth password is required when the first terminal tries to establish a connection when the password usage is enabled.
2. If no input is received within 2 minutes of a password input request (E403), Bluetooth communication will be disconnected.
3. If an error occurs during the CBTConnect command check (the number of parameters, whether the command is a query, etc.), the flow chart sequence follows the same path as when the password verification fails.
4. The above sequence between “Addition start” and “Addition end” is not recorded in the general log.
