User's Manual

Model 436101/436102/436103/436104/436106/ 437101/437102/437103/437104/437106/ 437112/437118/437124 µR10000/µR20000 Communication Interface

IM 04P01B01-17E 8th Edition

Introduction

Thank you for purchasing the YOKOGAWA μ R10000/ μ R20000 Recorder. This user's manual describes the functions of the Ethernet interface and the RS-422A/485 communication interface. To ensure correct use, please read this manual thoroughly before beginning operation. After reading the manual, keep it in a convenient location for quick reference whenever a question arises during operation.

The following manuals, including this one, are provided as manuals for the $\mu R10000/$ $\mu R20000$ Recorder. Please read all of them.

The figures used in this manual are mostly of the μ R10000. If you are using the μ R20000, refer to the figures for reference.

Paper Manual

Manual Title	Manual No.	Description
µR10000 Recorder Operation Guide	IM 04P01B01-02E	Explains the basic operations of the μ R10000 recorder.
µR20000 Recorder Operation Guide	IM 04P02B01-02E	Explains the basic operations of the μ R20000 recorder.

Electronic Manuals

Manual Title	Manual No.	Description
µR10000 Recorder User's Manual	IM 04P01B01-01E	Explains all the functions and procedures of the $\mu R10000$ recorder excluding the communication
		functions.
µR20000 Recorder	IM 04P02B01-01E	Explains all the functions and procedures of the
User's Manual		µR20000 recorder excluding the communication
		functions.

Notes

- The contents of this manual are subject to change without prior notice as a result of continuing improvements to the instrument's performance and functions. The figures given in this manual may differ from those that actually appear on your screen.
- Every effort has been made in the preparation of this manual to ensure the accuracy of its contents. However, should you have any questions or find any errors, please contact your nearest YOKOGAWA dealer as listed on the back cover of this manual.
- Copying or reproducing all or any part of the contents of this manual without the permission of Yokogawa Electric Corporation is strictly prohibited.
- The TCP/IP software of this product and the document concerning the TCP/IP software have been developed/created by YOKOGAWA based on the BSD Networking Software, Release 1 that has been licensed from the University of California.

QR Code

The product has a QR Code pasted for efficient plant maintenance work and asset information management.

It enables confirming the specifications of purchased products and user's manuals. For more details, please refer to the following URL.

Functional Enhancement of the Recorder

The functions of the recorder have been added or changed as shown in the figure below. You can check the system version on the system display. For details, see the $\mu R10000$ *User's Manual* (IM 04P01B01-01E) or the $\mu R20000$ *User's Manual* (IM 04P02B01-01E).

	1			, , ,		
Version	Suffix Code		Added or Modified Functions	Reference		
	μR10000 only					
1.1x	-	(Changed)	Expanded the selectable range of alarm values during linear scaling (including 1-5V and SQRT) to -5% to 105% of the scale.	Sec. 4.4: SA command		
	-	(Changed)	The procedure to set the start/end date and time of Daylight Saving Time (DST) has been changed.	Sec. 4.4: TD command		
			The TD command can be used on the μ R20000 and the μ R10000 with system version 1.11.			
			The SS command can be used on the μ R10000 with system version 1.02 or earlier.			
	_	(Added)	The printout/display format of the date can be changed.	Sec. 4.5: XN command		
	/C3	(Changed)	Modbus slave protocol can be used. Two-wire system.	Sec. 4.5: YS command Sec. 3.2		
	/C7	(Changed)	Users with the same user name cannot be registered.	Sec. 2.5		
1.43	-	(Changed)	For the pen model	Sec. 4.5		
			The setting range of the UA command (recording	Sec. 4.6		
			position adjustment) was expanded to integers			
			between -45 and 45.			
			Common to µR10000 and µR20000			
1.2x	-2	(Added)	Language support (German and French).	Sec. 4.5: UL command

How to Use This Manual

Structure of the Manual

This user's manual consists of the following sections.

Chapter 1	Overview of the Communication Functions
Gives a	n overview of the communication functions.
Chapter 2	Using the Ethernet Interface (/C7 Option)
Explain	s the specifications of the Ethernet interface and how to use the interface.
Chapter 3	Using the RS-422A/485 Communication Interface (/C3 Option)
Explain	s the specifications of the RS-422A/485 communication interface and how to use
the inte	rface.
Chapter 4	Commands
Explain	s each command that is available.
Chapter 5	Responses
Explain	s the responses that the recorder returns and the output format of the setup data
and me	asured/computed data.
Chapter 6	Status Information
Explain	s the registers that indicate the recorder statuses.
Appendix	
Provide	s an ASCII character code table, flow charts for outputting data from the recorder
login pr	ocedure, and a list of error messages.
Index	
Index o	f contents.

Conventions Used in This Manual

• Unit

- k: Denotes 1000. Example: 5 kg, 100 kHz
- K: Denotes 1024. Example: 640 KB

Note

The following markings are used in this manual.

Improper handling or use can lead to injury to the user or damage to the instrument. This symbol appears on the instrument to indicate that the user must refer to the user's manual for special instructions. The same symbol appears in the corresponding place in the user's manual to identify those instructions. In the manual, the symbol is used in conjunction with the word "WARNING" or "CAUTION."

WARNING Calls attention to actions or conditions that could cause serious or fatal injury to the user, and precautions that can be taken to prevent such occurrences.

Note Calls attention to information that is important for proper operation of the instrument.

Bold Characters

Bold characters are mainly characters and numbers that appear on the display.

• Subheadings

On pages that describe the operating procedures in Chapter 2 and 3, the following symbols are used to distinguish the procedures from their explanations.

Explanation

This subsection describes the setting parameters and the limitations on the procedures.

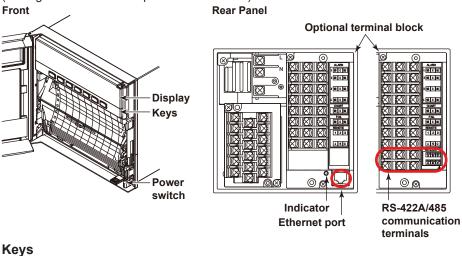

Procedure

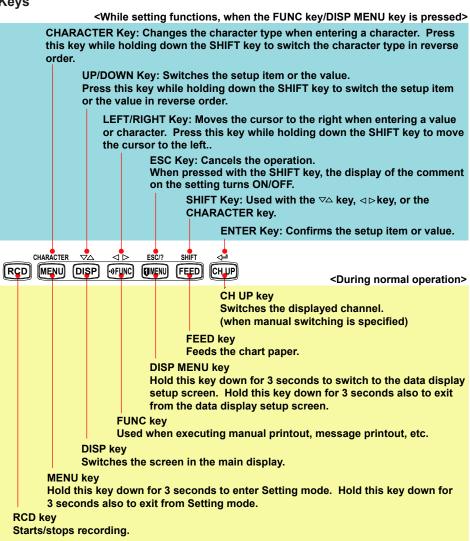

Follow the numbered steps. All procedures are written with inexperienced users in mind; depending on the operation, not all steps need to be taken.

Names of Parts and Basic Key Operations

Display and Keys

You use the panel keys and the display to configure the communication functions. For a description of other parts of the recorder, see section 3.1 in the *Recorder User's Manual*. (The figure below is of the μ R10000 Recorder.)

Basic Key Operations

This section describes basic operations on the front panel keys to change various settings.

Execution Modes

The recorder has the following execution modes.

- Operation mode: A mode used to perform recording and monitoring.
- Setting mode: A mode used to set the input range, alarms, chart speed, and other parameters.
- Basic Setting mode: A mode used to set the basic specifications of functions with the recording operation stopped.
 - * In the explanation of commands in (chapter 4), Run mode collectively refers to Operation mode and Setting mode.

Settings related to communications are configured in Basic Setting mode. You cannot enter Basic Setting mode while the recorder is recording or while computation is in progress on the computation function (/M1 option).

• Entering Basic Setting Mode

Hold down the MENU key for 3 seconds.

The Setting mode display appears.

Set= <mark>Ra</mark>	ange		
Input	range	and	s

The panel keys are set to the functions marked above the keys as shown below.

Hold down both the $\nabla \Delta$ (DSP) key and the $\triangleleft \triangleright$ (FUNC) key for 3 seconds. The Basic Setting mode display appears. The top and bottom lines are the setup item and comment, respectively. The section that is blinking in the setup item that you change. In this manual, the section that you change appears shaded.

The comment line shows useful information such as a description of the setup item and the range of selectable values. Read the comment and change the items as necessary.

Setup item → Basic=Alarm ← Comment → Auxiliary alarm The item to be controlled blinks.

· Selecting the Setup Item and Value

The selected item change each time you press the $\nabla \Delta$ (DISP) key. The selected item change in reverse order if you press the $\nabla \Delta$ (DISP) while holding down the **SHIFT** ((FEED) key.

This manual denotes the operation of pressing a key while holding down the **SHIFT** ((FEED)) key as **SHIFT** + the other key (for example: **SHIFT** + $\nabla \Delta$ key).

After you make a selection, press the <≓ (CHUP) key. The next screen appears. When the **Setting Complete** screen appears, the changed item is applied.

```
Ethernet host
Setting complete
```

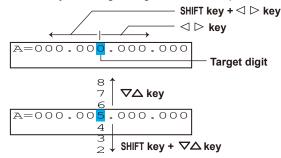

Using the ESC Key

If you press the **ESC** (**W**EW) key, the operation is cancelled, and the display returns to a higher level menu. If you do not show the Setting Complete screen, the changes you made up to that point are discarded.

You can show and hide the comment on the bottom line by pressing the **ESC** (**WEW**) key while holding down the **SHIFT** (**FED**) key.

• Entering Values

Use the $\triangleleft \triangleright$ key or **SHIFT** + $\triangleleft \triangleright$ key to move the cursor. Use the $\bigtriangledown \triangle$ key or **SHIFT** + $\bigtriangledown \triangle$ key to change a digit value. You repeat these steps to enter the value.

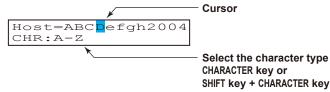

When you press the <>>> key, the change is applied and the next setup item is displayed.

Entering Characters

Use the $\triangleleft \triangleright$ key or **SHIFT** + $\triangleleft \triangleright$ key to move the cursor.

Use the CHARACTER key or SHIFT + CHARACTER key to select the character type.

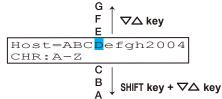

The character type changes in the following order: uppercase alphabet (A-Z), how are character type to the second at the second state (\mathbf{A}, \mathbf{Z}) , the second state (\mathbf{A}, \mathbf{Z}) is the second state of the second state of

lowercase alpha	bet (a-z), numbers	(0-9), and symbols	(%).
-----------------	-----------------------------	-----------------------------	---------------

A-Z	A to Z, and space
a-z	a to z, and space
0-9	0 to 9, and space
%	%, #, °, @, +, –, *, /, (,), μ , Ω , ² , ³ , ., and space

Use the $\nabla \Delta$ key or **SHIFT** + $\nabla \Delta$ key to select a character.

You repeat these steps to set the character string.

When you press the <- key, the change is applied and the next screen is displayed.

Inserting Characters

Press the $\triangleleft \triangleright$ key or **SHIFT** + $\triangleleft \triangleright$ key to move the cursor to the position where the character is to be inserted.

Press the **CHARACTER** key or **SHIFT** + **CHARACTER** key to show **Ins DISP** and then press the $\nabla\Delta$ key. A space for one character is inserted. Enter the character.

— Position to insert the character

Deleting a Character

Use the $\triangleleft \triangleright$ key or **SHIFT** + $\triangleleft \triangleright$ key to move the cursor to the character to be deleted.

Press the **CHARACTER** key or **SHIFT** + **CHARACTER** key to show **Del DISP** and then press the $\nabla\Delta$ key. The character is deleted.

Deleting an Entire Character String

Press the **CHARACTER** key or **SHIFT** + **CHARACTER** key to show **Clear DISP** and then press the $\nabla \Delta$ key. The entire character string is deleted.

Copying & Pasting a Character String

Show the copy source character string.

Press the **CHARACTER** key or **SHIFT** + **CHARACTER** key to show **Copy DISP** and then press the $\nabla \Delta$ key. The character string is saved to the memory. Show the copy destination. Press the **CHARACTER** key or **SHIFT** + **CHARACTER** key to show **Paste DISP** and

then press the $\nabla \Delta$ key. The character string is pasted.

Exiting from Basic Setting Mode

Press the **ESC** key several times to return to the **Basic=** screen. Press the $\nabla\Delta$ key or **SHIFT** + $\nabla\Delta$ key to select **End** and then press the $\triangleleft \mu$ key. The setup save screen appears.

Basic= <mark>End</mark>	
Save Setting	

Press the $\textbf{\nabla} \Delta$ key to select Store and then press the $\triangleleft \textbf{H}$ key.

The setting is applied and the Operation mode screen appears.

If you select **Abort** and press the <- key, the setting is discarded and the Operation mode screen appears.

End=	Store	
Save	settings	and

1.1 Communication Functions Using the Ethernet Interface (/C7 Option)

The recorder can be equipped with an optional Ethernet interface. For details on how to use the Ethernet interface, see chapter 2.

Functional Construction

The following figure shows the relationship between the communication function of the recorder and the Ethernet interface. Perform communication according to the respective protocol.

 Protocol is a set of rules that two computers use to communicate via a communication line (or network).

	Communication functions of the recorder		
	Setting/ Measurement Server	Maintenance/ Test Server	
Application	Login (user authentication/access privileges granting)		Instrument Information Server
Upper layer protocol	Dedicated protocol		
Lower layer		ТСР	UDP
protocol		IP	
Interface	Ethernet (10BASE-T)		

TCP (Transmission Control Protocol) UDP (User Datagram Protocol) IP (Internet Protocol)

Setting/Measurement Server

- You can specify settings that are approximately equivalent to those specified by front panel key operations. However, you cannot turn the power ON/OFF, set the user name and password for communications, nor set the key lock.
- The data below can be output.

Data Type	Output Format
Measured/computed data	BINARY/ASCII
Setup data	ASCII
Periodic printout and the most recent TLOG computation data	ASCII
Status information	ASCII
Information on connected users	ASCII

• The commands that can be used are Setting commands, Basic Setting commands, Control commands, and Output commands.

<Related Topics>

- Ethernet interface settings: Section 2.3
- Commands: Section 4.2
- Data output format: Chapter 5

1

1.1 Communication Functions Using the Ethernet Interface (/C7 Option)

Maintenance/Test Server

- Outputs Ethernet communication information such as connection information and network statistics from the recorder.
- The commands that can be used Maintenance/Test commands.

<Related Topics>

- Ethernet interface settings: Section 2.3
- Commands: Section 4.2

Instrument Information Server

- Outputs the serial number, model name, and other information about the recorder connected via the Ethernet network.
- The commands that can be used Instrument Information Output commands.

<Related Topics>

- Ethernet interface settings: Section 2.3
- Commands: Section 4.2

1.1 Communication Functions Using the Ethernet Interface (/C7 Option)

Other Functions

Login Function

Only users that are registered in advance can access the Setting/Measurement and Maintenance/Test servers.

- · Users are identified by their user name and password.
- You can register one administrator and six users.
- Administrator privileges

The administrator can use all the functions on the Setting/Measurement and Maintenance/Test servers

User Privileges

- Setting/Measurement server Users can output measured data, setup data, scheduled printing, and the most recent TLOG computation data. Users cannot control the recorder.
- Maintenance/Test server Users cannot disconnect communications between the recorder and other PCs. All other operations are allowed.
- There is a maximum number of simultaneous connections that can be established with the recorder.

<Related Topics>

- · Login function settings: Section 2.5
- · Maximum number of simultaneous connections: Section 2.1
- · Commands available to the administrator and users: Section 4.2

Communication Timeout

This function drops the connection with the PC if there is no data transmission for a given time at the application level (see "Functional Construction"). For example, this function prevents a PC from being connected to the recorder indefinitely which would prohibit other users from making new connections for data transfer.

<Related Topics>

- Communication timeout setting: Section 2.6
- Keepalive

This function drops the connection if there is no response to the inspection packet that is periodically transmitted at the TCP level.

<Related Topics>

• Keepalive setting: Section 2.6

1.2 Communication Functions Using the RS-422A/485 Communication Interface (/C3 Option)

The recorder can be equipped with an optional RS-422A/485 communication interface. For details on how to use the RS-422A/485 communication interface, see chapter 3.

Functional Construction

The following figure shows the relationship between the communication function of the recorder and the RS-422A/485 communication interface. Perform communication according to the respective protocol.

 Protocol is a set of rules that two computers use to communicate via a communication line (or network).

	Communication func	tions of the recorder
Application	Setting/Measurement Server	Modbus Slave
Protocol	Dedicated protocol	Modbus protocol
Interface	RS-422	2A/485
Connect the recorder and the PC using a serial cable.		

Setting/Measurement Server

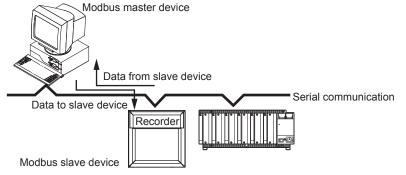

The functions are the same as those of the Setting/Measurement server of the Ethernet interface. See page 1-1.

<Related Topics>

- RS-422A/485 communication interface settings: Section 3.5
- Commands: Section 4.2
- RS-422A/485 dedicated commands: Section 4.8
- Data output format: Chapter 5

Modbus Slave

- The Modbus protocol can be used to read the measured/computed data on your PC by reading the input registers of the recorder. The communication input data can be written or read by writing/reading the hold register of the recorder.
- For details on the Modbus function codes that the recorder supports, see section 3.4.
- This function can be used only when communicating via the serial interface (option).
- For a description on the settings required in using this function, see section 3.5.

2.1 Ethernet Interface Specifications

Basic Specifications

Item	Specifications
Electrical and mechanical specifications	Conforms to IEEE 802.3
	(Ethernet frames are of DIX specification)
Transmission medium type	10BASE-T
Protocol	TCP, IP, UDP, ICMP, and ARP

MAC Address

MAC address is indicated on the label that is stuck on the recorder. Remove the chart cassette from the recorder to see the label.

The Maximum Number of Simultaneous Connections and the Number of Simultaneous Use

The following table shows the maximum number of simultaneous connections, the

number of simultaneous users, and the port numbers of the recorder.

Function	Maximum Number	Number of Simulta	aneous Users	Port Number [†]
	of Connections	<administrators></administrators>	<users></users>	
Setting/Measurement	3	1	2 ^{††}	34260/tcp
server				
Maintenance/Test	1	1	1 ^{††}	34261/tcp
server				
Instrument	-	-	-	34264/udp
Information server				

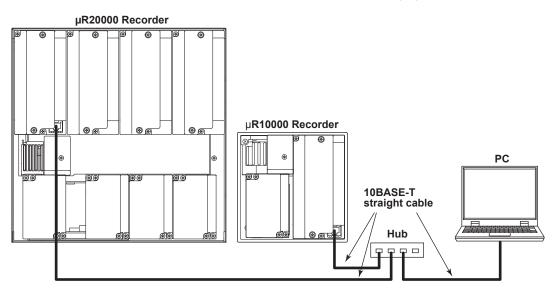

^{\intercal} The port numbers are fixed.

 $^{\dagger\dagger}\,$ For details on administrator and user privileges, see "Login Function" in section 1.1.

2.2 Connecting the Ethernet Interface

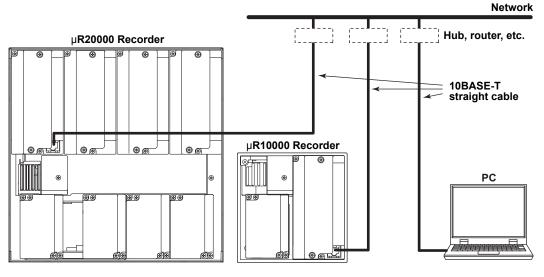

When Connecting Only the Recorder and a PC

Connect the recorder and the PC via a HUB as in the following figure.

When Connecting to a Preexisting Network

The following figure illustrates an example in which a recorder and a PC are connected to the network. When connecting the recorder or the PC to a preexisting network, the transfer rate, connector type, etc. must be matched. For details, consult your system or network administrator.

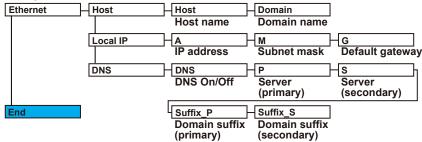

Note .

- Depending on the reliability of the network or the volume of network traffic, all the transferred data may not be retrieved by the PC.
- Communication performance deteriorates if multiple PCs access the recorder simultaneously.

2.3 Configuring the Ethernet Interface

Set the host name and IP address of the recorder. You do not have to set the DNS (domain name system).

Setup Items

Procedure

For a description of the basic setup operations, see "Basic Key Operations" on page vi. **Entering Basic Setting Mode**

Hold down the **MENU** key for 3 seconds to display the Setting mode screen. Next, hold down both the $\nabla \Delta$ (**DISP**) key and the $\triangleleft \triangleright$ (**FUNC**) key for 3 seconds to display the Basic Setting mode screen.

Note.

To cancel an operation, press the **ESC** key.

Basic=<mark>Ethernet</mark>

Host Name and Domain Name

1. Press the $\nabla \Delta$ key to select **Ethernet** and then press the $\prec \exists$ key.

- Set the host name of the recorder and then press the <
 <p>key.

 Key operations
 - Use the *⊲ ⊳* key to select the digit for entering a character.
 - Use the CHARACTER key to select the character type.
 - Use the \u03c6\u03c6 key to select the character you wish to enter.

Host=

4. Set the domain name and press the <⊨ key in the same fashion as in step 3. The setting complete screen appears.

- **5.** Press the **ESC** key to return to the higher level menu. To save the settings and exit from Basic Setting mode, proceed to "Saving the Settings."
- * When the $\triangleleft \triangleright$ key, $\bigtriangledown \land$ key, or CHARACTER key is pressed while holding down the SHIFT key, the operation is reversed as when the respective key is pressed by itself.

2.3 Configuring the Ethernet Interface

IP Address, Subnet Mask, and Default Gateway

- 2. Press the \(\nbox\) key to select Local IP and then press the \(\not\) key.
 Ethernet=Local IP
- 3. Set the IP address of the recorder and then press the <- key.

Key operations

- Use the *⊲ ⊳* key to select the digit for entering a value.
- Use the ∇△ key to select the value you wish to enter.

4. Set the IP address of the subnet mask and then press the <- key in the same fashion as in step 3.

5. Set the IP address of the default gateway and then press the <⊢ key in the same fashion as in step 3.

The local IP setting complete screen appears.

6. Press the **ESC** key to return to the higher level menu. To save the settings and exit from Basic Setting mode, proceed to "Saving the Settings."

DNS (Domain Name System)

- 2. Press the $\nabla \Delta$ key to select **DNS** and then press the \triangleleft key.

3. Press the $\nabla \Delta$ key to select **On** and then press the \triangleleft key.

Ethernet=DNS

Key operations

- Use the ⊲ ▷ key to select the digit for entering a value.
- Use the ∇△ key to select the value you wish to enter.

5. Set the IP address of the secondary DNS server and then press the <⊢ key in the same fashion as in step 4.

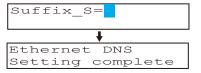

When the $\triangleleft \triangleright$ key, $\bigtriangledown \land \land$ key, or **CHARACTER** key is pressed while holding down the **SHIFT** key, the operation is reversed as when the respective key is pressed by itself.

- **6.** Set the primary domain suffix and then press the <⊢ key. Key operations
 - Use the *⊲ ⊳* key to select the digit for entering a character.
 - Use the CHARACTER key to select the character type.
 - Use the ∇△ key to select the character you wish to enter.

7. Set the secondary domain suffix and then press the <⊢ key in the same fashion as in step 6.

The DNS setting complete screen appears.

8. Press the **ESC** key to return to the higher level menu. To save the settings and exit from Basic Setting mode, proceed to "Saving the Settings."

Saving the Settings

- 1. Press the ESC key to return to the Basic= screen.
- **2.** Press the $\nabla \Delta$ key to select **End** and then press the \triangleleft key.

Explanation

For details on the settings, consult your system or network administrator.

Host Name

Set the recorder's host name and the domain name of the network to which the recorder belongs. Be sure to set these items when using the DNS.

- Host
 - Set the recorder's host name using up to 64 alphanumeric characters.
- Domain

Set the network domain name to which the recorder belongs using up to 64 alphanumeric characters.

• IP Address, Subnet Mask, and Default Gateway

• IP address

- Set the IP address to assign to the recorder. The default value is 0.0.0.0.
- The IP address is used to distinguish between the various devices connected to the Internet when communicating using the TCP/IP protocol. The address is a 32-bit value normally expressed with four values (0 to 255), each separated by a period as in 192.168.111.24.
- M (Subnet Mask)
 - Specify the mask that is used to determine the network address from the IP address. The default value is 0.0.0.0.
 - Set this value according to the system or the network to which the recorder belongs. In some cases, this setting may not be necessary.
- When the $\triangleleft \triangleright$ key, $\bigtriangledown \land \land$ key, or **CHARACTER** key is pressed while holding down the **SHIFT** key, the operation is reversed as when the respective key is pressed by itself.

• G (Default Gateway)

- Set the IP address of the gateway (router, etc.) used to communicate with other networks. The default value is 0.0.0.0.
- Set this value according to the system or the network to which the recorder belongs. In some cases, this setting may not be necessary.

• Setting the DNS (Domain Name System)

The DNS is a system that correlates the host name/domain name to the IP address. The host name/domain name can be used instead of the IP address when accessing the network. The DNS server manages the database that contains the host name/ domain name and IP address correlation.

On/Off

Select On when using the DNS.

- **P (Primary DNS Server)** Set the IP address of the primary DNS server. The default value is 0.0.0.0.
- **S (Secondary DNS Server)** Set the IP address of the secondary DNS server. The default value is 0.0.0.0. If the primary DNS server is down, the secondary server is used to search the host name and IP address correlation.
- Suffix_P (Primary Domain Suffix), Suffix_S (Secondary Domain Suffix) When the recorder searches another server using the DNS server, the domain name of the recorder is appended to the host name as a possible domain name if it is omitted. If the IP address corresponding to the server name is not found on the DNS server, then it may be that the system is configured to use another domain name for searching. This alternate domain name is specified as the domain suffix.
 - · Set the domain suffix using up to 64 alphanumeric characters.
 - · Up to two domain suffixes can be specified (primary and secondary).

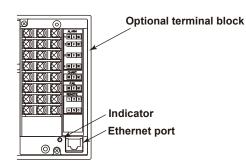

• Saving the Settings

To activate the settings made in the Basic Setting mode, the settings must be saved.

2.4 Checking the Connection Status

The connection status of the Ethernet interface can be confirmed with the indicator that is located to the left of the Ethernet port on the recorder.

Indicator	Connection Status of the Ethernet Interface
ON (Green)	The Ethernet interface is electrically connected.
Blinking (Green)	Transmitting data.
OFF	The Ethernet interface is not electrically connected.

2.5 Registering Users

Users that can access the recorder via the Ethernet network must be registered. This function is called login function.

Setup Items

Procedure

For a description of the basic operations, see "Basic Key Operations" on page vi.

Entering Basic Setting Mode

Hold down the **MENU** key for 3 seconds to display the Setting mode screen. Next, hold down both the $\nabla \Delta$ (**DISP**) key and the $\triangleleft \triangleright$ (**FUNC**) key for 3 seconds to display the Basic Setting mode screen.

Note

To cancel an operation, press the **ESC** key.

Enabling/Disabling the Login Function

- 2. Press the \sigma key to select Login and then press the <\ key.</p>
 Ethernet=Login

Login=	On	

4. Press the ESC key to return to the Ethernet menu.

Registering Users

- 5. Press the \sigma key to select LoginSet and then press the <\ key.</p>
 Ethernet=LoginSet
- 6. Press the
 ¬△ key to select Admin (administrator) or User1 to User6, and then press the
 → key.

Lev	rel=	Admin	

Register=<mark>On</mark>

7. Press the $\nabla \Delta$ key to select **On** and then press the \triangleleft key.

When the $\triangleleft \triangleright$ key, $\neg \triangle$ key, or CHARACTER key is pressed while holding down the SHIFT key, the operation
is reversed as when the respective key is pressed by itself

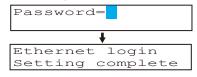

8. Set the user name and then press the \triangleleft key.

Key operations

- Use the ⊲ ⊳ key to select the digit for entering a character.
- · Use the CHARACTER key to select the character type.

9. Set the password and then press the <⊨ key in the same fashion as in step 8. The setting complete screen appears.

To register other users, press the $\lt =$ key to return to step 6 and repeat steps 8, 8, and 9.

Saving the Settings

- 1. Press the ESC key to return to the Basic= screen.
- **2.** Press the $\nabla \Delta$ key to select **End** and then press the $\prec \exists$ key.

Explanation

You can limit the users that can access the Setting/Measurement and Maintenance/Test servers on the recorder via the Ethernet interface.

- Enabling/Disabling the Login Function Set whether to use the login function.
- Registering Users
 - User level

Select either of the user levels, administrator or user.

Administrator

One administrator can be registered. An administrator has the authority to use all Setting/Measurement server and Maintenance/Test server commands.

• User

Six users can be registered. A user has limited authority to use the commands. See section 4.2.

- Selecting Whether to Register (On/Off) the User If On is selected, set the user name and password.
- Setting the User Name
 - Set the user name using up to 16 alphanumeric characters.
 - The same user name can not be registered.
 - Since the word "quit" is reserved as a command on the recorder, the user name "quit" is not allowed.
- Setting the Password

Set the password using up to 4 alphanumeric characters and spaces.

* When the ⊲ ▷ key, ▽△ key, or CHARACTER key is pressed while holding down the SHIFT key, the operation is reversed as when the respective key is pressed by itself.

Note ____

- The relationship between the login function and the user name that is used when accessing the recorder is as follows:
 - When the login function is set to "Use"
 - The registered user name and password can be used to login to the recorder.
 - The user level is the level that was specified when the user name was registered.
 - When the login function is set to "Not"
 - The user name "admin" can be used to login to the recorder as an administrator. Password is not necessary.
 - The user name "user" can be used to access the recorder as a user. Password is not necessary.
- There are limitations on the number of simultaneous connections or simultaneous uses of the recorder from the PC (see section 2.1).
- For a description of the login process of the Setting/Measurement server and Maintenance/ Test server, see appendix 3.

• Saving the Settings

To activate the settings made in the Basic Setting mode, the settings must be saved.

2.6 Setting the Communication Timeout and Keepalive

The communication timeout function and the keepalive function can be configured.

Setup Items

Procedure

For a description of the basic operations, see "Basic Key Operations" on page vi.

Entering Basic Setting Mode

Hold down the **MENU** key for 3 seconds to display the Setting mode screen. Next, hold down both the $\nabla \Delta$ (**DISP**) key and the $\triangleleft \triangleright$ (**FUNC**) key for 3 seconds to display the Basic Setting mode screen.

Note.

To cancel an operation, press the ESC key.

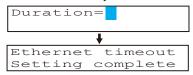

Communication Timeout

- Press the \sigma A key to select Timeout and then press the <₽ key.
 Ethernet=Timeout
- 3. Press the \sigma key to select On and then press the <\ key.</p>

 Timeout=On
- **4.** Set the timeout time and then press the <⊨ key. The setting complete screen appears.

Key operations

- Use the *⊲ ⊳* key to select the digit for entering a value.
- Use the *¬*△ key to select the value you wish to enter.

5 Press the **ESC** key to return to the higher level menu. To save the settings and exit from Basic Setting mode, proceed to "Saving the Settings."

When the $\triangleleft \triangleright$ key, $\bigtriangledown \land \land$ key, or **CHARACTER** key is pressed while holding down the **SHIFT** key, the operation is reversed as when the respective key is pressed by itself.

2.6 Setting the Communication Timeout and Keepalive

Keepalive

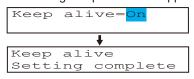

1. Press the $\nabla \Delta$ key to select **Ethernet** and then press the \triangleleft key.

2. Press the $\nabla \Delta$ key to select **K.Alive** and then press the $\prec \exists$ key.

3. Press the *¬*△ key to select **On** and then press the *¬*⊨ key. The setting complete screen appears.

4. Press the **ESC** key to return to the higher level menu. To save the settings and exit from Basic Setting mode, proceed to "Saving the Settings."

Saving the Settings

- 1. Press the ESC key to return to the Basic= screen.
- **2.** Press the $\nabla \Delta$ key to select **End** and then press the \triangleleft key.

Explanation

The communication timeout function and the keepalive function can be configured.

- Communication Timeout
 - Selecting On or Off If On is selected, set the timeout time.
 - **Timeout Time** If communication timeout is enabled, the connection is dropped if no data transfer is detected over a time period specified here. Selectable range: 1 to 120 minutes
- Enabling (On)/Disabling (Off) Keepalive Select On to enable the keepalive function.
- · Saving the Settings

To activate the settings made in the Basic Setting mode, the settings must be saved.

<Related Topics>

Keepalive: Section 1.1

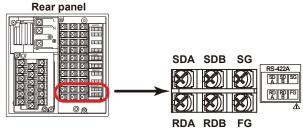

^{*} When the *⊲ ▷* key, *¬△* key, or **CHARACTER** key is pressed while holding down the **SHIFT** key, the operation is reversed as when the respective key is pressed by itself.

3.1 RS-422A/485 Communication Interface Specifications

This section describes the RS-422A/485 communication interface specifications.

Item	Specifications
Terminal block type	Number of terminals: 6, terminal attachment screws: ISO
	M4/nominal length of 6 mm
Electrical and mechanical	Complies with the EIA-422A(RS-422A) and
specifications	EIA-485(RS-485) standards
Connection	Multidrop Four-wire system 1:32
	Two-wire system 1:31 (Modbus slave protocol)
Transmission mode	Half-duplex
Synchronization	Start-stop synchronization
Baud rate	Select from 1200, 2400, 4800, 9600, 19200, and 38400 [bps].
Start bit	Fixed to 1 bit
Data length	Select 7 or 8 bits
Parity	Select Odd, Even, or None (no parity).
Stop bit	Fixed to 1 bit
Received buffer length	2047 bytes
Escape sequence	Open and close
Electrical characteristics	6 points consisting of FG, SG, SDB, SDA, RDB, and RDA
	The SG, SDB, SDA, RDB, and RDA terminals and the
	internal circuitry of the recorder are functionally isolated.
	The FG terminal is the frame ground.
Communication distance	Up to 1.2 km
Terminal resistance	120 Ω, 1/2 W

Terminal Arrangement and Signal Names

Terminal Name	Description
FG (Frame Ground)	Case ground of the recorder.
SG (Signal Ground)	Signal ground.
SDB (Send Data B)	Send data B (+).
SDA (Send Data A)	Send data A (–).
RDB (Received Data B)	Receive data B (+).
RDA (Received Data A)	Receive data A (–).

Connection Procedure

Cable

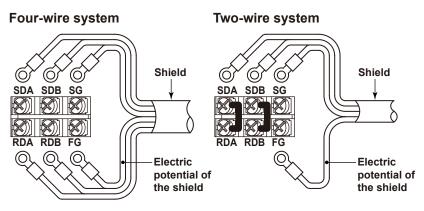

Use the cable that meets the conditions below.

Item	Conditions
Cable	Shielded twisted pair cable
	3 pairs AWG24-14 (Four-wire system),
	2 pairs 24 AWG or more (Two-wire system)
Characteristic impedance	100 Ω
Capacitance	50 pF/m
Cable length	Up to 1.2 km*

The transmission distance of the RS-422A/485 interface is not the straight-line distance, but rather the total length of the (shielded twisted-pair) cable.

• Connecting the Cable

As shown in the following figure, attach a crimp-on lug with isolation sleeves for 4 mm screws to the end of the cable. Keep the exposed section from the end of the shield within 5 cm.

WARNING

To prevent the possibility of electric shock, connect the cables with the power turned OFF.

Note

- Connect the RD pin to the SD (TD) pin on the PC (converter) end and the SD pin to the RD pin on the PC end.
- The two-wire system can be used only when using the Modbus protocol.

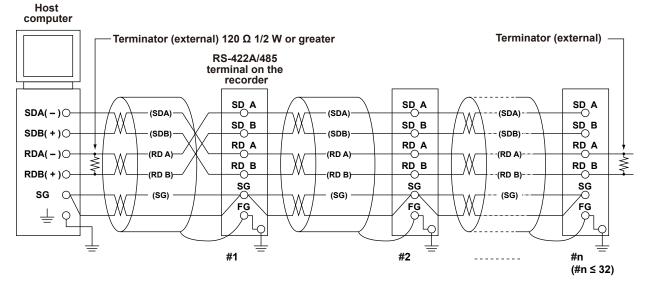

Connection Example with a Host Computer

A connection can be made with a host computer having a RS-232, RS-422A, or RS-485 port.

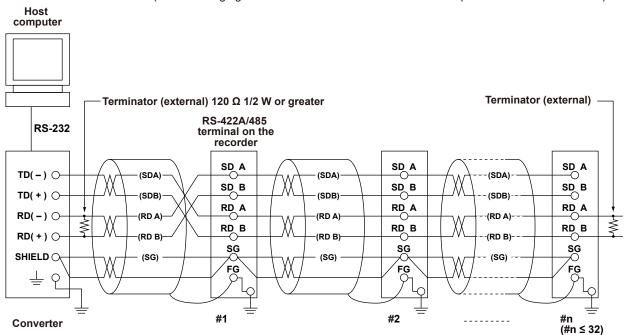

- In the case of RS-232, a converter is used.
- · For recommended converters, see "Serial Interface Converter" on the next page.
- The two-wire system can be used only when using the Modbus protocol. For the configuration procedure, see section 3.5

Four-Wire System

Generally, a four-wire system is used to connect to a host computer. In the case of a four-wire system, the transmission and reception lines need to be crossed over.

Do not connect terminators to #1 through #n-1.

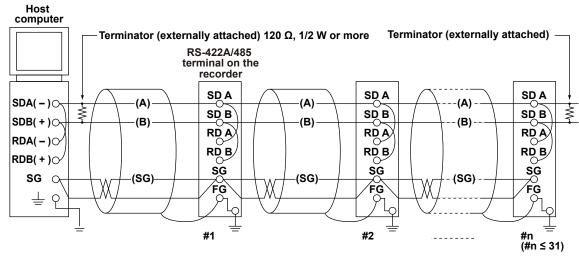

(The following figure illustrates the case when the host computer's interface is RS-232.)

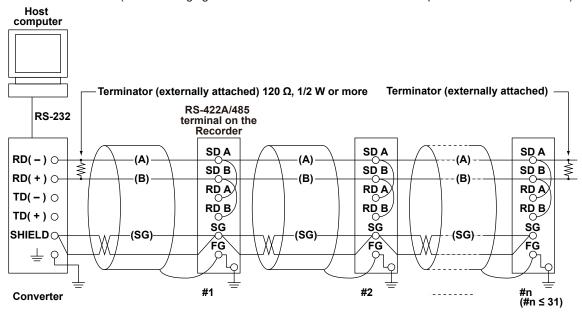

• Two-Wire System

Do not connect terminators to #1 through #n-1.

Connect the transmission and reception signals with the same polarity on the RS-422A/485 terminal block. The two-wire system can be used only when using the Modbus protocol.

Do not connect terminator to #1 to #n-1

(The following figure illustrates the case when the host computer's interface is RS-232.)

Note_

The method used to eliminate noise varies depending on the situation. In the connection example, the shield of the cable is connected only to the recorder's ground (one-sided grounding). This is effective when there is a difference in the electric potential between the computer's ground and the recorder's ground. This may be the case for long distance communications. If there is no difference in the electric potential between the computer's ground and the recorder's ground, the method of connecting the shield also to the computer's ground may be effective (two-sided grounding). In addition, in some cases, using two-sided grounding with a capacitor connected in series on one side is effective. Consider these possibilities to eliminate noise.

Do not connect terminator to #1 to #n-1

 When using the two-wire type interface (Modbus protocol), the 485 driver must be set to high impedance within 3.5 characters after the last data byte is sent by the host computer.

Serial Interface Converter

Recommended converter

SYSMEX RA CO., LTD./RC-770X, LINEEYE CO., LTD./SI-30FA, YOKOGAWA/ML2

CAUTION

Some converters not recommended by Yokogawa have FG and SG pins that are not isolated. In this case, do not connect anything to the converter's FG and SG pins (unlike the figure on the previous page). Especially in the case of long distance communications, the potential difference that appears may damage the recorder or cause communication errors. For converters that do not have the SG pin, they can be used without using the signal ground. For details, see the manual that came with the converter.

On some non-recommended converters, the signal polarity may be reversed (A/B or +/- indication). In this case, reverse the connection.

For a two-wire system, the host computer must control the transmission driver of the converter in order to prevent collisions of transmit and received data. When using the recommended converter, the driver is controlled using the RS (RTS) signal on the RS-232.

When Instruments That Support Only the RS-422A Interface Exist in the System

When using the four-wire system, up to 32 recorders can be connected to a single host computer. However, this may not be true if instruments that support only the RS-422A interface exist in the system.

When the instrument that support only the RS-422A interface exist in the system

The maximum number of connection is 16. Some of YOKOGAWA's conventional recorder only support the RS-422A driver. In this case, only up to 16 units can be connected.

Note.

In the RS-422A standard, 10 is the maximum number of connections that are allowed on one port (for a four-wire system).

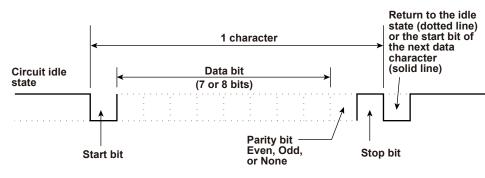

• Terminator

When using a multidrop connection (including a point-to-point connection), connect a terminator only to the recorder on the end of the chain. In addition, turn the terminator on the host computer ON (see the computer's manual). If a converter is being used, turn ON its terminator. The terminator must be attached externally to the recommended converters.

3.3 The Bit Structure of One Character and the Operation of the Receive Buffer

The Bit Structure of One Character

The serial interface on the recorder communicates using start-stop synchronization. In start-stop synchronization, a start bit is added every time a character is transmitted. The start bit is followed by the data bits, parity bit, and stop bit. (See the figure below.)

Receive Buffer and Received Data

The data received from the PC is first placed in the receive buffer of the recorder. When the received buffer becomes full, all of the data that overflow are discarded.

3.4 Modbus Slave Protocol Specifications

The Modbus slave protocol specifications of the recorder are as follows:

Serial Interface

Specifications
RS-422A/485
None only
Select from 1200, 2400, 4800, 9600, 19200, or 38400 [bps]
Fixed to 1 bit
Fixed to 1 bit
Select odd, even, or none (no parity).
RTU (Remote Terminal Unit) mode only
Data length: 8 bits
 Data interval: 24 bits or less*
 Error detection: Uses CRC-16
* Determines message termination with a time interval to 3.5
characters or more.
Four-wire system: 32 slave devices
Two-wire system: 31 slave devices

Slave Address

Address that can be set 1 to 32

Supported Functions

The function codes of the Modbus slave protocol that the recorder supports are shown below. The recorder does not support broadcast commands.

Function Code	Specifications	Operation	
3	Read the hold register (4xxxx).	The master device reads the communication input data written using function codes 6 and 16.	
4	Read the input register (3xxxx).	The master device loads the computed, measured, alarm, and time data of the recordr.	
6	Single write to hold register (4xxxx)	The master device writes to the communication input data of the recorder.	
8	Loopback test	The master device performs a loopback test of the recorder. The recorder only supports message return (test code 0x00*)	
16	Write to the hold register (4xxxx)	The master device writes to the communication input data of the recorder.	

Hexadecimal "00"

Communication Input Data

You can use the communication input data by describing it in the computing equations for the computation channels.

Registers

The registers for using the Modbus slave protocol are listed below. Binary values are stored to the register in order from the highest byte.

Input Register	Data
30001	Measured data of CH01
30002	Measured data of CH02
30003	Measured data of CH03
30004	Measured data of CH04
30005	Measured data of CH05
30006	Measured data of CH06
30007	Measured data of CH07
30008	Measured data of CH08
30009	Measured data of CH09
30010	Measured data of CH10
30011	Measured data of CH11
30012	Measured data of CH12
30013	Measured data of CH13
30014	Measured data of CH14
30015	Measured data of CH15
30016	Measured data of CH16
30017	Measured data of CH17
30018	Measured data of CH18
30019	Measured data of CH19
30020	Measured data of CH20
30021	Measured data of CH21
30022	Measured data of CH22
30023	Measured data of CH23
30024	Measured data of CH24

The data is a 16-bit signed integer. The value is the same as the measured data in binary output format (see page 5-14).

output format (see page 5-14). The decimal point and unit information are not included. Set them on the Modbus master.

• Valid channels vary depending on the device. An error response (code 2) occurs when an invalid channel is read.

Input Register	Data
31001	Alarm status of the measured data of CH01
31002	Alarm status of the measured data of CH02
31003	Alarm status of the measured data of CH03
31004	Alarm status of the measured data of CH04
31005	Alarm status of the measured data of CH05
31006	Alarm status of the measured data of CH06
31007	Alarm status of the measured data of CH07
31008	Alarm status of the measured data of CH08
31009	Alarm status of the measured data of CH09
31010	Alarm status of the measured data of CH10
31011	Alarm status of the measured data of CH11
31012	Alarm status of the measured data of CH12
31013	Alarm status of the measured data of CH13
31014	Alarm status of the measured data of CH14
31015	Alarm status of the measured data of CH15
31016	Alarm status of the measured data of CH16
31017	Alarm status of the measured data of CH17
31018	Alarm status of the measured data of CH18
31019	Alarm status of the measured data of CH19
31020	Alarm status of the measured data of CH20
31021	Alarm status of the measured data of CH21
31022	Alarm status of the measured data of CH22
31023	Alarm status of the measured data of CH23
31024	Alarm status of the measured data of CH24

• The value is the same as the alarm status in binary output format (see page 5-14). The data is entered in the "A2A1A4A3" order in the register.

• Valid channels vary depending on the device. An error response (code 2) occurs when an invalid channel is read.

3.4 Modbus Slave Protocol Specifications

Input Register	Data
32001	Computed data of CH0A (lower word)
32002	Computed data of CH0A (upper word)
32003	Computed data of CH0B (lower word)

32028	Computed data of CH1B (upper word)
32029	Computed data of CH1C (lower word)
32030	Computed data of CH1C (upper word)
32031	Computed data of CH1D (lower word)
32032	Computed data of CH1D (upper word)
32033	Computed data of CH1E (lower word)
32034	Computed data of CH1E (upper word)
32035	Computed data of CH1F (lower word)
32036	Computed data of CH1F (upper word)
32037	Computed data of CH1G (lower word)
32038	Computed data of CH1G (upper word)
32039	Computed data of CH1J (lower word)
32040	Computed data of CH1J (upper word)
32041	Computed data of CH1K (lower word)
32042	Computed data of CH1K (upper word)
32043	Computed data of CH1M (lower word)
32044	Computed data of CH1M (upper word)
32045	Computed data of CH1N (lower word)
32046	Computed data of CH1N (upper word)
32047	Computed data of CH1P (lower word)
32048	Computed data of CH1P (upper word)

• Registers corresponding to models with the /M1 computation function option.

- The data is a 32-bit signed integer. Two registers are assigned for each data point.
- The value is the same as the computed data in binary output format (see page 5-14).
- The decimal point and unit information are not included. Set them on the Modbus master.
- Valid channels vary depending on the device. An error response (code 2) occurs when an invalid channel is read.

Input Register	Data
33001	Alarm status of the computed data of CH0A
33002	Alarm status of the computed data of CH0B
33003	Alarm status of the computed data of CH0C
33004	Alarm status of the computed data of CH0D
33005	Alarm status of the computed data of CH0E
33006	Alarm status of the computed data of CH0F
33007	Alarm status of the computed data of CH0G
33008	Alarm status of the computed data of CH0J
33009	Alarm status of the computed data of CH0K
33010	Alarm status of the computed data of CH0M
33011	Alarm status of the computed data of CH0N
33012	Alarm status of the computed data of CH0P
33013	Alarm status of the computed data of CH1A
33014	Alarm status of the computed data of CH1B
33015	Alarm status of the computed data of CH1C
33016	Alarm status of the computed data of CH1D
33017	Alarm status of the computed data of CH1E
33018	Alarm status of the computed data of CH1F
33019	Alarm status of the computed data of CH1G
33020	Alarm status of the computed data of CH1J
33021	Alarm status of the computed data of CH1K
33022	Alarm status of the computed data of CH1M
33023	Alarm status of the computed data of CH1N
33024	Alarm status of the computed data of CH1P

Registers corresponding to models with the /M1 computation function option.

• The values are the same as those of the alarm status of the measured data.

• Valid channels vary depending on the device. An error response (code 2) occurs when an invalid channel is read.

Input Register	Data
36001	List of alarms of the measured data of CH01 to CH04
36002	List of alarms of the measured data of CH05 to CH08
36003	List of alarms of the measured data of CH09 to CH12
36004	List of alarms of the measured data of CH13 to CH16
36005	List of alarms of the measured data of CH17 to CH20
36006	List of alarms of the measured data of CH21 to CH24
36007 to 36020	Always 0
36021	List of alarms of the computed data of CH0A to CH0D
36022	List of alarms of the computed data of CH0E to CH0J
36023	List of alarms of the computed data of CH0K to CH0P
36024	List of alarms of the computed data of CH1A to CH1D
36025	List of alarms of the computed data of CH1E to CH1J
36026	List of alarms of the computed data of CH1K to CH1P

Example of Register 36001

<	1 registe	er (1 word)		→
CH4	СНЗ	CH2	CH1	_
The bit is set to when an alarm		Level 4 — Level		Level 1 – Level 2

- Registers 36001 to 36026 can be read with a single command.
- Bits corresponding to invalid channels are fixed to "0."

3.4 Modbus Slave Protocol Specifications

Input Register	Data
39001	Year (4 digits)
39002	Month
39003	Day
39004	Hour
39005	Minute
39006	Second
39007	Millisecond
39008	Summer/Winter time

• The data is a 16- bit signed integer.

Hold register	Data
40001	Communication input data of C01
40002	Communication input data of C02
40003	Communication input data of C03
40004	Communication input data of C04
40005	Communication input data of C05
40006	Communication input data of C06

40022	Communication input data of C22
40023	Communication input data of C23
40024	Communication input data of C24

• Registers corresponding to models with the /M1 computation function option.

- Pen model: C01 to C08, dot model: C01 to C12 (μR10000), C01 to C24 (μR20000)
- The data is a 16-bit signed integer.
- When writing to the register: A 16- bit signed integer only can be input.
- When reading from the register: The communication input data, a floating point, is converted to a 16- bit signed integer and output.

Hold registers	Data
40301	Communication input data of C01 (lower word)
40302	Communication input data of C01 (upper word)

• Registers corresponding to models with the /M1 computation function option.

- Pen model: C01 to C08; Dot model: C01 to C12 (μR10000), C01 to C24 (μR20000)
- The data is a floating point.
- When writing to the register: The values that can be input are -9.9999E29 to -1E-30, 0, and 1E-30 to 9.9999E29.

If a value exceeding this range is input, a computation error will occur when using the value on computation channels.

Modbus Error Response

The recorder returns the following error codes to the master device. For the error messages related to communications that the recorder displays, see appendix 4.

Code	Meaning	Cause
1	Bad function code	Unsupported function request.
2	Bad register number	Attempted to read/write to a register that has no corresponding channel.
3	Bad number of registers	The specified number of registers is less than or equal to 0 or greater than or equal to 126 (when reading)/124 (when writing).

However, no response is returned for the following cases.

- CRC error
- Errors other than those in the table above.

3.5 Setting the Serial Interface

The serial interface must be configured.

Setup Items

	bottap nonno				
	RS422/485	Address	Baud rate	Data length	– Parity –
Γ	End		Protocol		

Procedure

For a description of the basic operations, see "Basic Key Operations" on page vi.

Entering Basic Setting Mode

Hold down the **MENU** key for 3 seconds to display the Setting mode screen. Next, hold down both the $\nabla \Delta$ (**DISP**) key and the $\triangleleft \triangleright$ (**FUNC**) key for 3 seconds to display the Basic Setting mode screen.

Note .

To cancel an operation, press the ESC key.

- 2. Press the \scale A key to select the recorder's address and then press the <-> key.
 Address=1
- 3. Press the \scale A key to select the Baud rate value and then press the <- key.</p>
 Baud rate=38400
- 4 Press the \(\nbox\) A key to select the Data length value and then press the \(\nbox\) key.

 Data length=8
- 5 Press the $\nabla \Delta$ key to select the **Parity** value and then press the \triangleleft key.

6. Press the $\nabla \Delta$ key to select the **NORMAL** or **MODBUS** value and then press the \triangleleft^{2} key.

The setting complete screen appears.

Saving the Settings

- 1. Press the ESC key to return to the Basic= screen.
- **2.** Press the $\nabla \Delta$ key to select **End** and then press the \triangleleft key.
- * When the *ব ▷* key or *∇△* key is pressed while holding down the **SHIFT** key, the operation is reversed as when the respective key is pressed by itself.

Explanation

Address

Select the address from the following range. 01 to 32

Baud rate

Select the baud rate from the following: 1200, 2400, 4800, 9600, 19200, or 38400

Data length

Select the data length from below. To output data in BINARY format, be sure to set the data length to 8 bits.

7 or 8

• Parity (Parity check method)

Select the parity check from the following: Odd, Even, or None

Protocol

Select the protocol when using the Modbus slave protocol. NORMAL: Standard protocol MODBUS: Modbus slave protocol

• Saving the Settings

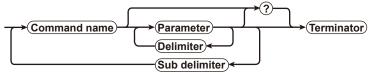

To activate the settings made in the Basic Setting mode, the settings must be saved.

Blank

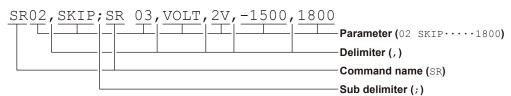

4.1 Command Syntax

The syntax of the setting/basic setting/output commands (see sections 4.4 to 4.7) of the instrument is given below. ASCII codes (see appendix 1) are used for the character codes. For the Maintenance/Test command syntax, see section 4.9.

For the Instrument Information server command syntax, see section 4.10.

Command example

Command Name

Defined using two alphabet characters.

Parameter

- Command parameters.
- · Set using alphabet characters or numerical values.
- · Parameters are separated by delimiters (commas).
- When the parameter is a numerical value, the valid range varies depending on the command.
- Spaces before and after of the parameter are ignored (except for parameters that are specified using an ASCII character string (unit, tag, and message string), when spaces are valid.)
- You can omit the parameters that do not need to be changed from their current settings. However, delimiters cannot be omitted.

Example SR01,, 2V<terminator>

If multiple parameters are omitted and delimiters occur at the end of the command, those delimiters can be omitted.

Example SR01, VOLT, , , <terminator> → SR 01, VOLT<terminator>

- The number of digits of the parameters below is fixed. If the number of digits is not correct when entering the command, a syntax error results.
 - Date YY/MM/DD (8 characters)
 - YY: Year (Enter the lower two digits of the year.)
 - MM: Month
 - DD: Day
 - Time HH: MM: SS (8 characters)
 - HH: Hour
 - MM: Minute
 - SS: Second
 - Channel number: 2 characters (Example: 01, 0A)
 - Relay number: 3 characters (Example: I01)
 - Communication input data: 3 characters (Example: C02)
 - Constants used in the computation function (/M1 option): 3 characters (Example: K03)
 - · Remote control (/R1 option) input terminal status: 3 characters (Example: D04)

4.1 Command Syntax

• Query

- A question mark is used to specify a query.
- By placing a query after a command or parameter, the setting information of the corresponding command can be queried. Some commands cannot execute queries. For the query syntax of each command, see sections 4.4 to 4.7.
 - Example 1 SR[p1]? SR? or SRp1? can be executed.

Example 2 SA[p1[,p2]]? SA?, SAp1?, or SAp1, p2? can be executed.

- Delimiter
 - A comma is used as a delimiter.
 - Parameters are separated by delimiters.

Sub Delimiter

- · A semicolon is used as a sub delimiter.
- By separating each command with a sub delimiter, up to 10 commands can be specified one after another. However, the following commands and queries cannot be specified one after another. Use them independently.
 - Output commands other than BO, CS, and IF commands.
 - YE command
 - · Queries
- If there are consecutive sub delimiters, they are considered to be single. In addition, sub delimiters at the front and at the end are ignored.

Example ;SR01,VOLT;;;SR02,VOLT;<terminator> is taken to be SR01,VOLT;SR02,VOLT<terminator>.

• Terminator (Terminating Character)

Use either of the following two characters for the terminator.

- CR + LF (ODH OAH in ASCII code.)
- LF (OAH in ASCII code.)

Note .

- The total data length from the first character to the terminator must be less than 2047 bytes. In addition, the character string length of 1 command must be less than 512 bytes.
- · Commands are not case sensitive (with the exception of user-specified character strings).
- All the commands that are listed using sub delimiters are executed even if one of the commands is erroneous.
- Spaces that are inserted before and after a parameter are ignored. However, if spaces are inserted before a command, after a sub delimiter, or after a query, an error occurs.

Response

The recorder returns a response (affirmative/negative response) to a command that is separated by a single terminator.* The controller should follow the one command to one response format. When the command-response rule is not followed, the operation is not guaranteed.

For the response syntax, see section 5.1.

* The exceptions are the RS-422A/485 dedicated commands (see section 4.8).

Note .

When using the RS-422A/485 interface, allow at least 1 ms before sending the next command after receiving a response. Otherwise, the command may not be processed correctly.

4.2 A List of Commands

Execution Modes and User Levels

Execution Modes

The recorder has two execution modes. Each command is specified to be used in a particular execution mode. If you attempt to execute a command in a mode that is different from the specification, a syntax error occurs. Use the DS command to switch to the appropriate mode, and then execute the command. Query commands can be executed in either mode.

- Basic Setting mode
- Measurement/computation is stopped and settings are changed in this mode. Run mode
- *Run mode* collectively refers to Operation mode and Setting mode of the recorder. **User Levels**

The administrator and user specifications in the table indicate the user level that is specified using the login function for Ethernet communications. For details, see section 1.1.

Setting Commands *Note*

Settings cannot be changed when data is being replayed from the SD memory card.

Command Name	Function	Execution Mode	Administrator	User	Page
SR	Sets the input range.	Run mode	Yes	No	4-10
VB	Sets the bias.	Run mode	Yes	No	4-11
VL	Sets the calibration correction (/CC1 option).	Run mode	Yes	No	4-11
SA	Sets the alarm.	Run mode	Yes	No	4-11
SN	Sets the unit.	Run mode	Yes	No	4-12
SC	Sets the chart speed.	Run mode	Yes	No	4-13
SD	Sets the date and time.	Run mode	Yes	No	4-13
VT	Sets the dot printing interval (dot model).	Run mode	Yes	No	4-13
SZ	Sets zone recording.	Run mode	Yes	No	4-13
SP	Sets the partial expanded recording.	Run mode	Yes	No	4-13
VR	Turns ON/OFF the recording on each channel.	Run mode	Yes	No	4-14
ST	Sets the tag.	Run mode	Yes	No	4-14
SG	Sets the message.	Run mode	Yes	No	4-14
SE	Sets the secondary chart speed (used by the remote control function (/R1 option)).	Run mode	Yes	No	4-14
SV	Sets the moving average (dot model).	Run mode	Yes	No	4-14
SF	Sets the input filter (pen model).	Run mode	Yes	No	4-14
BD	Sets the alarm delay time.	Run mode	Yes	No	4-14
VF	Sets the brightness of the display (VFD) and internal illumination.	Run mode	Yes	No	4-14
TD	Sets the DST.	Run mode	Yes	No	4-15
SS	Sets the DST. (Can be used on the μ R10000 with system version 1.02 or earlier)	Run mode	Yes	No	4-15
SO	Sets the computing equation (/M1 option).	Run mode	Yes	No	4-15
SK	Sets the computation constant (/M1 option).	Run mode	Yes	No	4-15
SJ	Sets the timer used in TLOG computation (/M1 option).	Run mode	Yes	No	4-15
VD	Sets the data display screen.	Run mode	Yes	No	4-16
CM	Sets the communication input data (/M1 option).	Run mode	Yes	No	4-18
FR	Sets the acquiring interval to the FIFO buffer.	Run mode	Yes	No	4-18
VH	Sets the batch number and lot number (/BT1 option).	Run mode	Yes	No	4-18
VC	Sets the batch comment (/BT1 option).	Run mode	Yes	No	4-18
VP	Turns Start printout/End printout ON/OFF (/BT1 option).	Run mode	Yes	No	4-18
VA	Sets the Start printout/End printout action (/BT1 option).	Run mode	Yes	No	4-19
VM	Sets the message format (/BT1 option).	Run mode	Yes	No	4-19
VE	Sets data saving start and stop settings (/EM1 option).	Run mode	Yes	No	4-20
VJ	Selects the settings for data replay (/EM1 option).	Run mode	Yes	No	4-20

Yes: Command usable

No: Command not usable

Basic Setting Commands

Note.

- The settings that are returned in response to a query in the basic setting mode will contain the new settings even if they are not saved.
- In order to activate the settings that are changed using the basic setting commands, the settings must be saved using the YE or XE command.
- If the settings are saved with the XE command, communication is not dropped. If saved
 with the XE command, the settings that are changed using the YS/YB/YA/YN/YD/YQ/YK
 command are activated after power-cycling the recorder.
- When the YE command is executed, communication is dropped. The response to the YE command is not returned.
- The following settings cannot be changed. Key lock, enabling/disabling of the customized menu function, user registration for Ethernet communication.

Command	Function	Execution Mode	Administrator	User	Page
Name					
XA	Sets alarm related settings.	Basic Setting mode	Yes	No	4-21
XI	Sets the A/D integral time.	Basic Setting mode	Yes	No	4-21
XB	Sets the burnout detection.	Basic Setting mode	Yes	No	4-22
XJ	Sets the RJC.	Basic Setting mode	Yes	No	4-22
UC	Changes the dot color (dot model).	Basic Setting mode	Yes	No	4-22
UO	Sets the pen offset compensation (pen model).	Basic Setting mode	Yes	No	4-22
UP	Sets the items to be printed.	Basic Setting mode	Yes	No	4-22
UR	Sets the periodic printout interval.	Basic Setting mode	Yes	No	4-22
UM	Sets the types of report data that are output to the periodic printout.	Basic Setting mode	Yes	No	4-23
UB	Sets the display mode of the bar graph.	Basic Setting mode	Yes	No	4-23
UI	Sets whether to use moving average (dot model).	Basic Setting mode	Yes	No	4-23
UJ	Sets whether to use the input filter (pen model).	Basic Setting mode	Yes	No	4-23
UK	Sets whether to use of partial expanded recording.	Basic Setting mode	Yes	No	4-23
UL	Selects the display/printout language.	Basic Setting mode	Yes	No	4-23
XN	Selects the date format.	Basic Setting mode	Yes	No	4-23
XT	Selects the temperature unit.	Basic Setting mode	Yes	No	4-24
UF	Sets whether to use the extended functions.	Basic Setting mode	Yes	No	4-24
UT	Selects the time printout format.	Basic Setting mode	Yes	No	4-24
XR	Sets the remote control input (/R1 option).	Basic Setting mode	Yes	No	4-24
YS	Sets the RS-422A/485 interface (/C3 option).	Basic Setting mode	Yes	No	4-25
XQ	Sets the TLOG timer (/M1 option).	Basic Setting mode	Yes	No	4-25
UN	Changes the assignment of channels to the recording pen (pen model, /M1 option).	Basic Setting mode	Yes	No	4-25
US	Sets the computation error procedure (/M1 option).	Basic Setting mode	Yes	No	4-25
YВ	Sets the host name and domain name (/C7 option).	Basic Setting mode	Yes	No	4-26
YA	Sets the IP address (/C7 option).	Basic Setting mode	Yes	No	4-26
YN	Sets the DNS (/C7 option).	Basic Setting mode	Yes	No	4-26
YD	Sets whether to use the login function via communication (/C7 option).	Basic Setting mode	Yes	No	4-26
YQ	Sets the communication timeout (/C7 option)	Basic Setting mode	Yes	No	4-26
YK	Sets keepalive (/C7 option).	Basic Setting mode	Yes	No	4-26
UQ	Sets the calibration correction mode and the number of set points (/CC1 option).	Basic Setting mode	Yes	No	4-26
UA	Sets the record position.	Basic Setting mode	Yes	No	4-27
UG	Sets the Setting mode menu selection.	Basic Setting mode	Yes	No	4-27
UH	Sets the FUNC key menu selection.	Basic Setting mode	Yes	No	4-27
UE	Selects enable/disable for Start printout/End printout and message format (/BT1 option).	Basic Setting mode	Yes	No	4-28
YE	Exits from Basic Setting mode.	Basic Setting mode	Yes	No	4-28
XE	Exits from Basic Setting mode.	Basic Setting mode	Yes	No	4-28

Yes: Command usable

No: Command not usable

Control Commands *Note* -

You can only use the CC and JU command when data is being replayed from the SD memory card.

Key	Command	I Function	Execution Mode	Administrator	User	Page
	Name					
-	DS	Switches the execution mode.	All modes	Yes	No	4-29
RCD	PS	Starts/Stops recording.	Run mode	Yes	No	4-29
DISP	UD	Switches the screen/switches the channel.	Run mode	Yes	No	4-29
FUNC	AK	Executes alarm acknowledge (AlarmACK)	Run mode	Yes	No	4-29
FUNC	TL	Starts/stops/resets computation (/M1 option).	Run mode	Yes	No	4-29
FUNC	MP	Starts/Stops manual print.	Run mode	Yes	No	4-29
FUNC	LS	Starts/Stops the list (setting information) printout.	Run mode	Yes	No	4-29
FUNC	SU	Starts/Stops the setup list (basic setting information) printout.	Run mode	Yes	No	4-29
FUNC	MS	Executes the message printout.	Run mode	Yes	No	4-29
FUNC	AC	Clears the alarm printout buffer.	Run mode	Yes	No	4-29
FUNC	MC	Clears the message printout buffer.	Run mode	Yes	No	4-30
FUNC	VG	Resets the report data of the periodic printout.	Run mode	Yes	No	4-30
FUNC	JK	Starts/Stops data saving (/EM1 option).	Run mode	Yes	No	4-30
FUNC	JU	Starts/Stops data replay (/EM1 option).	Run mode	Yes	No	4-30
-	YC	Initializes the settings.	Basic Setting mode	Yes	No	4-30
-	CC	Disconnects the Ethernet connection (can be used for Ethernet communications).	All modes	Yes	Yes	4-30
-	JI	Formats the SD memory card (/EM1 option).	Basic Setting mode	Yes	No	4-30
-	LI	Saves setup data (/EM1 option).	Run mode	Yes	No	4-30
-	LO	Loads setup data for Setting mode (/EM1 option).	Run mode	Yes	No	4-30
-	YO	Loads setup data for Setting mode including those of Basic Setting mode (/EM1 option).	Basic Setting mode	Yes	No	4-30
-	UY	Stops the record position adjustment.	Basic Setting mode	Yes	No	4-31
-	UA	Adjusts the recording position.	Basic Setting mode	Yes	No	4-31
			0	Ves: Command	usable	<u> </u>

Yes: Command usable No: Command not usable

Output Commands *Note* -

Output using the FD, FY, and FF commands is not possible when data is being replayed from the SD memory card.

4.2 A List of Commands

Maintenance/Test Commands

	mese commands can be used only when using Ethemet communications.						
Command Name	Function	Execution Mode	Administrator	User	Page		
close	Disconnects the connection between other instruments.	All modes	Yes	No	4-34		
con	Outputs connection information.	All modes	Yes	Yes	4-34		
eth	Output Ethernets statistical information.	All modes	Yes	Yes	4-34		
help	Outputs help.	All modes	Yes	Yes	4-34		
net	Outputs network statistical information.	All modes	Yes	Yes	4-34		
quit	Disconnects the connection of the instrument being operated.	All modes	Yes	Yes	4-35		

These commands can be used only when using Ethernet communications.

Yes: Command usable No: Command not usable

Instrument Information Output Commands

These commands can be used only when using Ethernet communications.

Parameter	Function	Page
serial	Outputs the serial number.	4-35
host	Outputs the host name.	4-35
ip	Outputs the IP address.	4-35

4.3 Parameter Values

This section explains frequently used parameters.

Input Range

The following tables show the input types (VOLT, TC, RTD, DI, and 1-5V), range types, and the ranges for the leftmost and rightmost values of the span.

 DC Voltage (VOLT), Square Root (SQRT), Difference between Channels (DELTA)

Range Type		Range of Leftmost and	Range of Leftmost and
	the SR Command	Rightmost Values of Span	Rightmost Values of Span of the SR Command
20 mV	20 mV	-20.00 to 20.00 mV	-2000 to 2000
60 mV	60 mV	–60.00 to 60.00 mV	-6000 to 6000
200 mV	200 mV	-200.0 to 200.0 mV	-2000 to 2000
2 V	2 V	-2.000 to 2.000 V	-2000 to 2000
6 V	6 V	-6.000 to 6.000 V	-6000 to 6000
20 V	20 V	-20.00 to 20.00 V	-2000 to 2000
50 V	50 V	-50.00 to 50.00 V	-5000 to 5000

• 1-5V

Range Type	Parameter for the SR Command	Range of Leftmost and Rightmost Values of Span	Range of Leftmost and Rightmost Values of Span of the SR Command
1-5V	1-5V	Leftmost value:	800 to 1200
		0.8000 to 1.200 V	
		Rightmost value:	4800 to 5200
		4.8000 to 5.200 V	

• Thermocouple (TC)

Range Type	Parameter for	Ran	ge of Leftmost and	Rightmost Values of S	pan
	the SR Command	°C	SR Command	° F	SR Command
R	R	0.0 to 1760.0°C	0 to 17600	32 to 3200°F	32 to 3200
S	S	0.0 to 1760.0°C	0 to 17600	32 to 3200°F	32 to 3200
В	В	0.0 to 1820.0°C	0 to 18200	32 to 3308°F	32 to 3308
К	К	-200.0 to 1370.0°C	-2000 to 13700	–328 to 2498°F	-328 to 2498
E	E	–200.0 to 800.0°C	-2000 to 8000	-328.0 to 1472.0°F	-3280 to 14720

4.4	Setting Commands	Descriptio	 This command cannot be specified while computation is in progress.
SR	Sets the input range.		• For p3 and p4, enter an integer value of 5 digits or less according to the table in section
When se	etting channels to skip		4.3. The decimal place is fixed to the position
Syntax	SR p1,p2 <terminator></terminator>		indicated in the table in section 4.3.
	p1 Channel number		• Be sure that p6 is greater than p5.
	p2 Measurement mode (SKIP)		 Parameter p8 is valid only when the low-cut
Query	SR[p1]?		function is enabled (see the UF command).
Example	Set channel 01 to skip.		
	SR01,SKIP		omputing the difference between channels
Descriptio	n • This command cannot be specified while	Syntax	SR p1,p2,p3,p4,p5 <terminator></terminator>
Descriptio	computation is in progress.		p1 Channel number
	 Measurements are not made on channels that 		p2 Measurement mode (DELTA)
			p3 Reference channel
	are set to SKIP.		p4 Leftmost value of span
When se	tting channels to voltage, TC, RTD, or		p5 Rightmost value of span
ON/OFF		Query	SR[p1]?
Syntax	SR p1,p2,p3,p4,p5 <terminator></terminator>	Example	Set channel 03 to channel difference
Syntax	p1 Channel number		computation with respect to channel 01
	-		
	p2 Measurement mode (Input type)		(reference channel). Set the leftmost and
	VOLT DC voltage		rightmost values of span to −200.0 and 200.0,
	TC Thermocouple		respectively.
	RTD Resistance temperature		SR03, DELTA, 01, -2000, 2000
	detector	Description	n • This command cannot be specified while
	DI ON/OFF input		computation is in progress.
	p3 Range type		The reference channel must be a channel that
	p4 Leftmost value of span		is smaller in channel number than itself.
	p5 Rightmost value of span		 The range type is the same as that of the
Query	SR[p1]?		reference channel.
-			 For p4 and p5, enter an integer value of 5
Example	Measure 0°C to 1760.0°C on channel 01 using		
	thermocouple type R.		digits or less according to the table in section
	SR01,TC,R,0,17600		4.3. The decimal place is fixed to the position
Descriptio	n • This command cannot be specified while		indicated in the table in section 4.3.
	computation is in progress.	When se	etting the linear scaling
	 Set p3 according to the table in section 4.3. 	Syntax	SR p1,p2,p3,p4,p5,p6,p7,p8,p9
	 For p4 and p5, enter an integer value of 5 	- Official	<terminator></terminator>
	digits or less according to the table in section		
	4.3. The decimal place is fixed to the position		p1 Channel number
	indicated in the table in section 4.3.		p2 Measurement mode (SCALE)
			p3 Input type
When se	etting channels to 1-5V range		VOLT DC voltage
Syntax	SR p1,p2,p3,p4,p5,p6,p7,p8 <terminator></terminator>		TC Thermocouple
	p1 Channel number		RTD Resistance temperature
	p2 Measurement mode (Input type) (1-5V)		detector
	p3 Leftmost value of span		DI ON/OFF input
	p4 Rightmost value of span		p4 Range type
	p5 Leftmost value of scaling (-20000 to 30000)		p5 Leftmost value of span
	p6 Rightmost value of scaling (-20000 to 50000)		p6 Rightmost value of span
			-
	30000)		p7 Leftmost value of scaling (-20000 to 30000)
	p7 Scale decimal point position (0 to 4)		p8 Rightmost value of scaling (-20000 to
	p8 Whether to use 1-5V low-cut function (ON,		30000)
	OFF)		p9 Scaling decimal point position (0 to 4)
Query	SR[p1]?	Query	SR[p1]?
Example	Set channel 01 to 1-5V range and scale the input	Example	Scale channel 02 whose input range is 0 to 10 V
	value in the range 0.0 to 1200.0. Do not use the		to -100.0 to 500.0.
	low-cut function.		SR02, SCALE, VOLT, 20V, 0, 1000, -1000,

- integer (see section 4.3). Description • This command cannot be specified while • The bias setting is valid only when the bias function is enabled (see the UF command). VL Sets the calibration correction (/ CC1 option). VL,p1,p2,p3,p4,..., p33,p34 Syntax <terminator> p1 Channel number p2 pЗ р4 p33 Correction point p34 Correction value Query VL[p1]?
 - Example Set three sets of correction point and correction values when channel 02 is set to 2 V range (measurable range: -2.000 V to 2.000 V) and the calibration correction mode is set to Revise Value. (0.000 and 0.001), (1.000 and -0.002), and (2.000 and 0.001) VL 02, ON, 0, 1, 1000, -2, 2000, 1 Set three sets of correction point and correction

Correction point

Correction value

values when channel 02 is set to 2 V range (measurable range: -2.000 V to 2.000 V) and the calibration correction mode is set to Abs. Value. VL02, ON, 0, 1, 1000, 998, 2000, 2001

Calibration correction function (ON, OFF)

- Description The number of parameters p3 to p34 varies depending on the number of points specified by the basic setting command UQ.
 - · If the input type of the source channel is VOLT, TC, or RTD, the range of the correction point and correction values is the same as the range of the range type (see section 4.3).
 - · If the measurement mode of the source channel is SCALE or 1-5V, the range of the correction point and correction values is -5% to 105% of the scaling range or -20000 to 30000.
 - The following limitations exist. p3 < p5 \leq ... \leq p31 \leq p33
 - During revise value mode
 - p3+p4 < p5+p6 < ... < p33+p34
 - · During absolute value mode p4 < p6 < ... < p32 < p34

SA Sets the alarm.

When no	ot using the alarm
Syntax	SA p1,p2,p3 <terminator></terminator>
	p1 Channel number
	p2 Alarm number (1 to 4)
	p3 Alarm ON/OFF state (OFF)
Query	SA[p1[,p2]]?
Example	Do not use alarm number 4 of channel 01.
	SA01,4,OFF

When using the alarm

Syntax SA p1,p2,p3,p4,p5,p6,p7<terminator>

- p1 Channel number
- p2 Alarm number (1 to 4)

- For p5 and p6, enter an integer value of 5
- digits or less according to the table in section 4.3. The decimal place is fixed to the position indicated in the table in section 4.3.
- Be sure that p8 is greater than p7.

When setting the square root

Syntax

- SR p1,p2,p3,p4,p5,p6,p7,p8,p9,p10 <terminator>
- p1 Channel number
- Measurement mode (SQRT) p2
- p3 Range type
- p4 Leftmost value of span
- p5 Rightmost value of span
- p6 Leftmost value of scaling (-20000 to 30000)
- p7 Rightmost value of scaling (-20000 to 30000)
- p8 Scaling decimal point position (0 to 4)
- p9 Low-cut function (ON, OFF)
- p10 Low-cut value

Query SR[p1]?

Example

Given channel 01 whose input range is 0 to 10 V, take the square root of the input value and scale the result in the range 0.00 (m^3/s) to 100.00 (m^3/s) . When the input value is less than or equal to 5.0% of the recording span, use the low-cut function.

SR01, SQRT, 20V, 0, 1000, 0, 10000, 2, ON, 50

Description • This command cannot be specified while computation is in progress.

- Set p3 according to the table in section 4.3.
- · For p4 and p5, enter an integer value of 5 digits or less according to the table in section 4.3. The decimal place is fixed to the position indicated in the table in section 4.3.
- Be sure that p7 is greater than p6.
- Parameters p9 and p10 is valid only when the low-cut function is enabled (see the UF command)
- · Settings cannot be changed while data is being saved to the SD memory card (/EM1 option).

Sets the bias.

VB
Syntax

- VB p1,p2,p3<terminator> p1 Channel number
 - p2 Bias ON/OFF (ON, OFF)
- p3 Bias value
- Query VB[p1]?
- Example Given channel 03 whose range type is 2V (measurable range: -2.000 to 2.000 V), add a bias of 0.1 V VB03, ON, 100

Description • Set p3 in the range of ±10% of the span of the measurable range at the range type or ±10% of the scaling span. Specify the value with an

- p3 Alarm ON/OFF state (ON) p4 Alarm type H High limit alarm Low limit alarm T. h Difference high limit alarm Difference low limit alarm 1 R High limit on rate-of-change alarm r Low limit on rate-of-change alarm T Delay high limit alarm t Delay low limit alarm (Characters are case-sensitive.) p5 Alarm value p6 Relay output Relay ON ON Relay OFF OFF p7 Relay number (µR10000: I01 to I06, µR20000: I01 to I06, I11 to I16, I21 to I26, 131 to 136) Query SA[p1[,p2]]? Example Set a high limit alarm (alarm value = 1000) on alarm number 1 of channel 02 and output to relay I01. SA02,1,ON,H,1000,ON,I01 Description • When the input range is set to SKIP (SR command), p3 cannot be turned ON. · The alarm settings are all turned OFF for the following cases. · When the input type is changed (VOLT, TC, etc). When the range type is changed. · When the span and scaling values are changed during linear scaling (includes changing the decimal place). · The h and I settings of p4 are valid only when the measurement range is set to computation between channels. • The hysteresis of alarm ON/OFF (valid when p4 is H or L) is set using the XA command. • If p4 is set to R or r, set the interval for the high/low limit on the rate-of-change using the XA command. • The T and t settings of p4 can be specified when the alarm delay function is enabled (UF command) • If p4 is set to T or t, set the alarm delay time for the delay high/low limit alarm using the BD command Parameter p5 for the high limit alarm/low limit alarm and delay high limit alarm/delay lowlimit alarm · For DC voltage, TC, and RTD input: Values within the measurable range in the specified range (example: -2.000 to 2.000 V for the 2 V range). • For ON/OFF input (DI): 0 or 1. For scaling (1-5V, scaling, and square root):
 - -5 to 105% of the scale span (except within -20000 to 30000).
 - · Parameter p5 for the difference high limit

alarm/difference low limit alarm: Values in the measurable range can be specified (example: -1760.0 to 1760.0°C for the TC type R).

- · Parameter p5 for the high limit on rate-ofchange alarm/low limit on rate-of-change alarm: A value greater than or equal to 1 digit can be specified. For example, 1 digit corresponds 0.001 for the 2 V range (measurable range: -2.000 to 2.000 V). The maximum value that can be specified is the width of the measurable range (4.000 V for 2 V range). For ON/OFF input, only "1" can be specified
- On models with the computation function (/ M1 option), alarms can be set on computation channels.
 - When the computation equation setting (SO) command) is turned OFF, p3 cannot be turned ON.
 - For computation channels, the alarm types that can be specified are H (high limit alarm), L (low limit alarm), T (delay high limit alarm), and t (delay low limit alarm). T and t can be specified when the alarm delay function is enabled (UF command).
 - If p4 is set to T or t, set the alarm delay time for the delay high/low limit alarm using the BD command.
 - Set p5 within the range -9999999 to 99999999 excluding the decimal using an integer.
 - The alarm ON/OFF hysteresis is set using the XA command
 - If the computation channel ON/OFF state, the computing equation, or the span value is changed, all alarm settings of that channel are turned OFF.

SN Sets the unit.

Syntax	SN p1,p2 <terminator></terminator>
	p1 Channel number
	p2 Unit string (up to 6 characters)
Query	SN[p1]?
Example	Set the unit of channel 02 to M/H.
	SN02,M/H
Description	• The unit setting is valid on channels set to
	1-5V, scaling, or square root.
	• For the characters that can be used for the
	units, see appendix 1, "ASCII Character
	Codes."
	- On models with the computation function (/
	M1 option), unit can be set on computation
	channels.
	Settings cannot be changed while data is
	being saved to the SD memory card (/EM1
	option).

Syntax SD p1-terminator> On models with the computation function (/ P1 Date and time (fixed to the YY/MM/DD_HH: MM:SS format) M1 option), computation channels can be specified. being saved to the SD memory card (/EM1

option).

VR	Turns ON/OFF the recording on each channel.
Dot mode	4
Syntax	VR p1,p2,p3 <terminator></terminator>
	p1 Channel number
	p2 Trend recording ON/OFF (ON, OFF)
	p3 Periodic printout ON/OFF (ON, OFF)
Query	VR[p1]?
Example	Turn trend recording ON and turn periodic
	printout OFF on channel 06.
	VR06,ON,OFF
Description	On models with the computation function (/M1
	option), computation channels can be specified.
Pen mode	
Syntax	VR p1,p2 <terminator></terminator>
Oymax	p1 Channel number
	p2 Periodic printout ON/OFF (ON, OFF)
Query	VR[p1]?
Example	Turn periodic printing ON on channel 01.
Docorintian	VR01, ON
Description	On models with the computation function (/ M1 option), computation channels can be
	specified.
	 Settings cannot be changed while data is
	being saved to the SD memory card (/EM1
	option).
	option).
ST	Sets the tag.
Syntax	ST p1, p2 <terminator></terminator>
	p1 Channel number
	p2 Tag string (up to 7 characters)
Query	ST[p1]?
Example	Set the tag of channel 02 to TI-2.
	ST02,TI-2
Description	For the characters that can be used for the
	tags, see appendix 1, "ASCII Character
	Codes."
	On models with the computation function (/
	M1 option), computation channels can be
	specified.
	Settings cannot be changed while data is
	being saved to the SD memory card (/EM1
	option).
80	Sata the manager
SG	Sets the message.
Syntax	SG p1,p2 <terminator></terminator>
	p1 Message number (1 to 5)
•	p2 Message string (up to 16 characters)
Query	SG[p1]?
Example	Set character string "START" in message
	number 1.
D	SG1, START
Description	For the characters that can be used for the
	messages, see appendix 1, "ASCII Character
	Codes."

<u>SE</u>	Sets the secondary chart speed (used by the remote control function (/R1 option)).
Syntax	SE p1 <terminator> p1 Secondary chart speed See the explanation.</terminator>
Query Example	SE? Set the chart speed to 50 mm/h. SE50
Description	Select the chart speed from the list of choices below. Pen model 5 to 12000 mm/h (82 levels, see section 4.3) Dot model 1 to 1500 mm/h (1 mm steps)
SV	Sets the moving average (dot model).
Syntax	<pre>SV p1,p2<terminator> p1 Channel number p2 Number of samples for computing the moving average (OFF, 2 to 16) [times]</terminator></pre>
Query Example	SV[p1]? Set the number of samples for computing the moving average of channel 02 to 12. SV02, 12
Description	 This setting is available on the dot model. This setting is possible when moving average is enabled (UI command).
SF	Sets the input filter (pen model).
Syntax	SF p1, p2 <terminator> p1 Channel number p2 Filter time constant (OFF, 2s, 5s, 10s)</terminator>
Query Example	SF[p1]? Set the filter of channel 02 to 2 s. SF02,2s
Description	This setting is possible when the input filter is enabled (UJ command).
BD	Sets the alarm delay time.
Syntax	BD p1,p2 <terminator> p1 Channel number p2 Alarm delay (1 to 3600) [s]</terminator>
Query Example	BD[p1]? Set the alarm delay of channel 01 to 120 s. BD01,120
Description	 This setting is possible when the alarm delay function is enabled (UF command). On models with the computation function (/M1 option), computation channels can be specified.
<u>VF</u>	Sets the brightness of the display (VFD) and internal illumination.

Syntax VF p1, p2<terminator>

- p1 VFD brightness (1 to 8)
- p2 Internal illumination (OFF, 1 to 4) Turns OFF the internal OFF

illumination.

Querv VF? Example Set the display (VFD) brightness to 2 and the internal illumination to 1. VF2,1

Description The brightness increases as the value increases.

TD Sets the DST.

Syntax

- TD p1,p2,p3,p4,p5,p6,p7,p8,p9<terminator>
- p1 Use/Not use DST (USE, NOT)
- p2 DST start time: month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec)
- p3 DST start time: number of the week in the month (1st, 2nd, 3rd, 4th, or Last)
- p4 DST start time: day of the week (Sun, Mon, Tue, Wed, Thu, Fri, or Sat)
- p5 DST start time: hour (0 to 23)
- p6 DST end time: month (Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, or Dec)
- p7 DST end time: number of the week in the month (1st, 2nd, 3rd, 4th, or Last)
- p8 DST end time: day of the week (Sun, Mon, Tue, Wed, Thu, Fri, or Sat)
- p9 DST end time: hour (0 to 23)

Querv TD[p1]?

- Example Enable DST and set the DST start time to hour 0 on the 2nd Sunday of June and the DST end time to hour 0 on the 2nd Sunday of December. TDUse, Jun, 2nd, Sun, 0, Dec, 2nd, Sun, 0
- Description The DST start time and end time cannot be set to the same time.
 - The TD command can be used on the μ R10000 and μ R20000 with system version 1.11 or later. On the µR10000 with system version 1.02 or earlier, use the SS command.

SS Sets the DST.

Syntax

SS	p1,p2	2,p3 <te< td=""><td>erminator></td></te<>	erminator>

	p1	Standard time/DST selection				
		Winter Standard time				
		Summer DST				
	p2	Switch time setting ON/OFF (ON, OFF)				
	pЗ	Date and time (fixed to the YY/MM/DD HH				
		format)				
		YY Year (00 to 99, the lower 2 digits)				
		MM Month (01 to 12)				
		DD Day (01 to 31)				
		HH Hour (00 to 23)				
Query	SS[p1]?				
Example	Swi	tch to DST on 0 hour of June 1st, 2005.				
	SSS	Summer,ON,05/06/01 00				
Description	• F	Parameter p3 is not available when p2 is OFF				
	• 1	The SS command can be used on the				

OFF.

µR10000 with	system	version	1.02	or	earlier.
--------------	--------	---------	------	----	----------

SO	
30	

	printing with system version 1.02 of earlier.
<u>SO</u>	Sets the computing equation (/M1 option).
Syntax	SO p1,p2,p3,p4,p5,p6 <terminator></terminator>
	p1 Computation channel number
	p2 Turn ON/OFF the computing equation (ON, OFF)
	p3 Computing equation (up to 120 characters)
	p4 Leftmost value of span (-99999999 to 99999999)
	p5 Rightmost value of span (-99999999 to 99999999)
	p6 Span decimal point position (0 to 4)
Query	SO[p1]?
Example	Calculate the sum of channel 01 and 02 on
	computation channel 0A. Set the leftmost and
	rightmost values of span to -10.00 and 15.00, respectively.
	SOOA, ON, 01+02, -1000, 1500, 2
Description	This command cannot be specified while
	computation is in progress.
	• For a description on the computing equations,
	see the $\mu R10000$ Recorder User's Manual or
	the µR20000 Recorder User's Manual.
	 For p4 and p5, enter a value using 7 digits
	or less ,excluding the decimal, for negative
	numbers and 8 digits or less for positive numbers.
	 Settings cannot be changed while data is
	being saved to the SD memory card (/EM1 option).
<u>SK</u>	Sets the computation constant (/M1 option).
Syntax	SK p1,p2 <terminator></terminator>
	p1 Constant number (K01 to K30)
	p2 Constant (up to 11 characters)
	The range is -9.9999E+29 to -1.0000E-30,
	0, 1.0000E–30 to 9.9999E+29.
Query	(The + sign of "E+" can be omitted.) SK[p1]?
Example	Set 1.0000E-10 to constant K01. SKK01,1.0000E-10
Description	
	 Settings cannot be changed while data is
	being saved to the SD memory card (/EM1 option).
SJ	Sets the timer used in TLOG
	computation (/M1 option).
Syntax	SJ p1,p2,p3 <terminator></terminator>
	p1 Computation channel number
	p2 Timer number (Periodic, 1, 2)

- p3 Sum scale (for TLOG.SUM)
 - OFF Integrates the data per scan interval.

Description

4.5 Basic Setting Commands Hold the relay output until an

alarm acknowledge operation is

4.5 **Basic Setting Commands**

- · In order to activate the settings that are changed using the basic setting commands, the settings must be saved using the YE or XE command.
- The settings that are returned in response to a query in the basic setting mode will contain the new settings even if they are not saved.

Note .

Syntax

- The settings that are changed using the YS/YB/YA/YN/YD/YQ/ YK command and saved using the XE command are activated after power-cycling the recorder.
- When the YE command is executed, communication is dropped.

XA Sets alarm related settings.

XA p1,p2,p3,p4,p5,p6,p7,p8,p9,p10 <terminator>

- p1 Fault diagnosis output ON/OFF (ON, OFF)
- Reflash operation ON/OFF (ON, OFF) p2
- pЗ Relays that are to operate using AND logic NONE None (all relays operate using OR logic) T01 101 I01-I02 101, 102 I01-I03 I01 to I03 I01-I04 101 to 104 I01-I05 I01 to I05 I01-I06 I01 to I06 I01-I11 Ι01 to I11 (μR20000) I01-I12 I01 to I12 (µR20000) I01-I13 I01 to I13 (µR20000) I01-I14 I01 to I14 (µR20000) I01-I15 I01 to I15 (µR20000) 101-116 I01 to I16 (µR20000) I01-I21 I01 to I21 (µR20000) I01-I22 I01 to I22 (µR20000) I01-I23 I01 to I23 (µR20000) I01-I24 I01 to I24 (µR20000) 101-125 **I01 to I25 (µR20000)** I01-I26 **Ι01 to I26 (μR20000)** I01-I31 I01 to I31 (µR20000) I01-I32 I01 to I32 (µR20000) I01-I33 I01 to I33 (µR20000) I01-I34 ΙΟ1 to I34 (μR20000) 101-135 I01 to I35 (µR20000) I01-I36 I01 to I36 (µR20000) p4 Energize/De-energize the relay ENERGIZE Energize the relay when an alarm is detected DE ENERGIZE De-energize the relay when an alarm is detected
- p5 Hold/Not hold the relay

			executed		
		NONHOLD	Reset the relay output when the		
			alarm is cleared.		
	рб	Hold/Not hold the alarm status display			
		HOLD	Hold the display until an alarm		
			acknowledge operation is		
			executed		
		NONHOLD	Clear the display output when		
			the alarm is cleared.		
	p7	Interval for	the high limit on rate-of-change		
		alarm (01 t	o 15)		
	p8		the low limit on rate-of-change		
		alarm (01 t	,		
	p9		eresis on measurement channels

			that are in unit of /hour.
		/day	Integrates the physical amount
			that are in unit of /day.
Query	UM [p1]?	
Example	Prin	t the aver	age values of channel 03 using
	peri	odic printe	out.
	UM0	3,AVE	
Description	• T	his setting	g is possible when printing of report
	d	ata (p4 is	REPORT) is specified using the
	ι	JR comma	and.
	• A	bout p3	
	Т	he data f	or sum computation are sampled
			n interval. For data with units such
		-	, /h, and /day as in a flow rate,
			an be summed over the unit time.
			p3 is valid only for sum values.
			s with the computation function
			n), computation channels can be
	s	pecified.	

	4.5 Basic Setting Commanus
UB	Sets the display mode of the bar graph.
Syntax	UB p1, p2 <terminator></terminator>
,	p1 Channel number
	p2 Bar graph display mode
	NORMAL The reference position is set to the smaller of the two values, leftmost value and rightmost value. CENTER The reference position is set to the 50% position.
Query	UB[p1]?
Example	Display channel 01 using a bar graph with the reference position set to the 50% position. UB01, CENTER
Description	On models with the computation function (/M1 option), computation channels can be specified.
<u>UI</u>	Sets whether to use moving average (dot model).
Syntax	UI p1 <terminator> p1 Use/Not use moving average (USE, NOT)</terminator>
Query	UI?
Example	Use moving average.
UJ	Sets whether to use the input filter (pen model).
Syntax	UJ p1 <terminator> p1 Use/Not use the input filter (USE, NOT)</terminator>
Query	UJ?
Example	Use the input filter.
<u>UK</u>	Sets whether to use of partial expanded recording.
Syntax	UK p1 <terminator> p1 Use/Not use partial expanded recording (USE, NOT)</terminator>
Query	UK?
Example	Use partial expanded recording. UKUSE
UL	Selects the display/printout language.
Syntax	UL p1 <terminator> p1 Language (ENGLISH, JAPANESE, GERMAN, FRENCH)</terminator>
Query	UL?
Example	Use English.
	ULENGLISH
XN	Selects the date format.
Syntax	XN pl <terminator></terminator>
	p1 Date format for displaying and printing
	Y/M/D (example) 2005/08/31

Y/M/D (example) 2005/08/31

4.5 Basic Setting Commands

M/D/Y	(example) 08/31/2005
D/M/Y	(example) 31/08/2005
D.M.Y	(example) 31.08.2005
M.D.Y	(example) Aug.31.2005
XN?	

Example	Set to the "2005/08/31" format.
	XNY/M/D

Description This setting applies to the format of the date shown on the display and the date printed on the periodic printout, manual printout, alarm printout, message printout, recording start printout, new chart speed printout, and start printout and end printout (header printout (/BT1 option)).

Note

Query

How this setting applies to the time printout format of the alarm printout, message printout, recording start printout, and new chart speed printout: The setting specifies the format of the "M/D" and "Y/M/D" section when the time printout format is set to "M/D H:M," "M/D H:M:S," or "Y/M/D H:M:S."

XT Syntax	Selects the temperature unit.	Example	Set the all time printouts UTHH:MM,HH:MM,HH:M
	p1 Temperature unit C °C F °F	<u>XR</u>	Sets the remote (/R1 option).
Query Example	XT? Use °F. XTF	Syntax	XR p1, p2 <terminator> p1 Remote control inpu 5) p2 Action NONE</terminator>
<u>UF</u>	Sets whether to use the extended functions.		Record On/Off Chart speed
Syntax	 UF p1, p2, p3, p4, p5<terminator></terminator> p1 Bias function (USE, NOT) p2 Square root low-cut function (USE, NOT) 		Time adjust
	 p3 1-5V input low-cut function (USE, NOT) p4 Alarm delay function (USE, NOT) p5 Calibration correction function (USE, NOT) 		Math start/stop
	(/CC1 option). This cannot be used with the bias.		Math reset Manual print
Query Example	UF? Use the calibration correction extended function. The bias function is not used.		Alarm Ack
Descriptior	 UFNOT, USE, USE, USE, USE The input offset is set using the VB command. The low-cut function is set using the SR command. The delay alarm is set using the SA and BD commands. 		Message1 Message2 Message3 Message4 Message5 Priority R_RCD
	 Parameter p5 can be specified on models with the calibration correction (/CC1 option). Use the UQ and VL commands to set the correction values. 		BatchCMT switch DataSave On/Off
UT	Selects the time printout format.		
Syntax	UT p1, p2, p3, p4 <terminator> p1 Time printout format of the alarm printout</terminator>	Query	XR[p1]?

Second YMD H:M:S Month Day Year Hour:Minute: Second None No time printout p3 Time printout format of the record start time printout The available selections are the same as those of p2. None is not available. p4 Time printout format of the new chart speed printout The available selections are the same as those of p2. None is not available. Query UT? ne printouts to Hour:Minute format. H:MM,HH:MM,HH:MM

The available selections are the same as those of p2. None is not available. p2 Time printout format of the message printout

Hour:Minute

HH:MM:SS Hour:Minute:Second M/D H:M Month Day Hour:Minute M/D H:M:S Month Day Hour:Minute:

4.5 Basic Setting Commands

US+OVER,LIMIT

YB	Sets the host name and domain name (/C7 option).
Syntax	YB p1, p2 <terminator></terminator>
	p1 Host name (up to 64 characters)
	p2 Domain name (up to 64 characters)
Query	YB?
Example	Set the host name to "ABC" and the domain name to "recorder.co.jp."
	YBABC,recorder.co.jp
Description	The settings specified by this command and
	saved using the XE command take effect after
	the recorder is power cycled.
YA	Sets the IP address (/C7 option).
Syntax	YA p1,p2,p3 <terminator></terminator>
	p1 IP address (0.0.0.0 to 255.255.255.255)
	p2 Subnet mask
	(0.0.0.0 to 255.255.255.255)
	p3 Default gateway
	(0.0.0.0 to 255.255.255.255)
Query	YA?
Example	Set the IP address to 192.168.111.24, the subnet
	mask to 255.255.255.0, and the default gateway
	to 0.0.0.0.
	YA192.168.111.24,255.255.255.0,
	0.0.0
Description	The settings specified by this command and
	saved using the XE command take effect after
	the recorder is power cycled.
YN	Sets the DNS (/C7 option).
When not	using the DNS
Syntax	YN p1 <terminator></terminator>
	p1 Use/Not use the DNS (OFF)
Query	YN?
Example	Do not use the DNS.
	YNOFF
When usi	ng the DNS
Syntax	YN p1,p2,p3,p4,p5 <terminator></terminator>
	p1 Use/Not use the DNS (ON)
	p2 Address of the primary DNS server
	(0.0.0.0 to 255.255.255.255)

- p3 Address of the secondary DNS server (0.0.0.0 to 255.255.255.255)
- p4 Domain suffix 1 (up to 64 characters)
- p5 Domain suffix 2 (up to 64 characters)

Query YN?

Example	Use the DNS server at 192.168.0.1.
	YNON,192.168.0.1

Description The settings specified by this command and saved using the XE command take effect after the recorder is power cycled.

<u>YD</u>	Sets whether to use the login function via communication (/C7 option).
Syntax	<pre>YD p1<terminator> p1 Use/Not use the login function via communication (USE, NOT)</terminator></pre>
Query	YD?
Example	Use the login function via communication.
Description	The settings specified by this command and saved using the XE command take effect after the recorder is power cycled.
YQ	Sets the communication timeout (/C7 option).
When not	using the timeout
Syntax	YQ p1 <terminator></terminator>
	p1 Enable/Disable communication timeout (OFF)
Query	YQ?
Example	Disable timeout.
	YQOFF
When usi	ng the timeout
Syntax	YQ p1, p2 <terminator></terminator>
Oymax	p1 Enable/Disable communication timeout (ON)
	p2 Timeout time (1 to 120) [minutes]
Query	YQ?
Example	Enable communication timeout and set the timeout period to 3 min.
Description	The settings specified by this command and saved using the XE command take effect after the recorder is power cycled.
YK	Sets keepalive (/C7 option).
Syntax	YK p1 <terminator></terminator>
-	p1 Enable/Disable keepalive (ON, OFF)
Query	
Example	Disable keepalive. YKOFF
Description	The settings specified by this command and
	saved using the XE command take effect after
	the recorder is power cycled.
UQ	Sets the calibration correction mode and the number of calibration set points (/CC1 option).
Suptor	- /
Syntax	UQ p1, p2, p3 <terminator> p1 Channel number</terminator>
	p1 Channel humber p2 Setting mode
	- county mode

p3 Number of calibration set points (2 to 16)

Query UQ[p1]?

	STORE Apply the settings		
	ABORT Discard the settings		
Example	Apply the basic settings.		
Example	YESTORE		
Description	Applies the settings changed with the basic		
	setting commands.		
	- 1		

<u>XE</u> Exits from Basic Setting mode.

Communication is not dropped when the XE command is executed.

Control Commands 4.6

Switches the execution mode. DS

Syntax DS p1<terminator>

Example

- p1 Mode
 - 0 Run mode
 - 1 Basic Setting mode
- Switch to Basic Setting mode. DS1
- Description The execution mode cannot be changed to Basic Setting Mode while recording or computation is in progress.

PS Starts/Stops recording.

Syntax	PS p1 <terminator></terminator>		
	p1 Start/Stop recording.		
	0 Start		
	1 Stop		
Example	Start recording.		
	PSO		

UD Switches the screen/switches the channel.

Returning to the data display screen

Returns from the Setting mode screen, the screen that appears when the FUNC key is pressed, or the screen that appears when the DISP MENU key is pressed back to the measurement data display screen.

UD p1<terminator> Syntax p1 Fixed to 0. Example Return to the data display screen. UDO

Displaying the specified data display screen

Syntax	UD p1,p2 <terminator></terminator>			
	p1 Fixed to 1.			
	p2 Screen number (1 to 15)			
Example	Display data display screen 2.			
	UD1,2			

Switching the display channel (manual switching)

UD p1<terminator> Syntax p1 Fixed to 2. Switch the display channel. Example UD2 Description • An error results if the specified screen is set to SKIP for UD1. • UD2 is valid on screens whose display channel is set to manual switching. Executes alarm acknowledge AK (Alarm ACK).

Syntax	AK p1 <terminator></terminator>
	p1 Executes alarm acknowledge (0)
Example	Execute alarm acknowledge.
	AK0

TL Syntax

Starts/stops/resets computation (/M1 option). TL p1<terminator>

- p1 Operation type 0 Computation start 1 Computation stop Computation reset 2 Start the computation. Example TL0 Starts/Stops manual print. Syntax MP p1<terminator>
- p1 Operation type Manual print start 0 1 Manual print stop Example Start manual print. MP0
- LS

MP

Starts/Stops the list (setting information) printout.

Syntax	LS p1 <terminator></terminator>				
	p1 Operation type				
	0 List print start				
	1 List print stop				
Example	Start list print.				
	LSO				
Description	List print refers to printing of settings of Setting mode.				

SU

Starts/Stops the setup list (basic setting information) printout.

	÷
Syntax	SU p1 <terminator></terminator>
	p1 Operation type
	0 Setup list print start
	1 Setup list print stop
Example	Start setup list print.
	SUO
Description	Setup list print refers to printing of settings of
	Basic Setting mode.
MS	Prints the message.
Syntax	MS p1 <terminator></terminator>
	p1 Message number (1 to 5)
Example	Print the message of message number 3.
	MS3
Description	The message string is set with the SG command.

AC Clears the alarm printout buffer.

Syntax	AC p1 <terminator></terminator>
	p1 Clear the alarm printout buffer (0)
Example	Clear the alarm printout buffer.
	AC0

4.6 Control Commands

MC	Clears the message printout buffer.
Syntax	MC p1 <terminator> p1 Clear the message printout buffer (0)</terminator>
Example	Clear the message printout buffer.
VG	Resets the report data of the periodic printout.
Syntax	VG p1 <terminator></terminator>
	p1Operation type2Reset the report data of the periodic
Example	printout. Reset the report data of the periodic printout.
Description	This setting is valid when the recorder is set to print the report data using periodic printout.
JK	Starts/stops data saving.
Syntax	JK p1 <terminator></terminator>
Oyntax	p1 Start/stop data saving
	0 Start
	1 Stop
Example	Start data saving.
	JKO
Description	This command is valid on products with SD
	memory card (/EM1 option).
JU	Starts/stops data replay.
When sta	Starts/stops data replay. rting data replay
	Starts/stops data replay. rting data replay JU p1,p2,p3,p4 <terminator></terminator>

YC	Initializas sattings			
	Initializes settings.			
Syntax	YC p1 <terminator></terminator>			
	 p1 Initialization type 0 Initialize the Setting mode and Basic 			
	Setting mode settings.			
	1 Initialize the Setting mode settings.			
Example	Initialize the Setting mode and Basic Setting			
	mode settings.			
	YCO			
<u>CC</u>	Disconnects the Ethernet			
	connection (/C7 option).			
Syntax	CC p1 <terminator></terminator>			
	p1 Disconnection (0)			
Example	Disconnect the connection.			
	CC0			
JI	Formats the SD memory card.			
Syntax	JI p1 <terminator></terminator>			
e j mart	p1 Volume label			
	-			
Example	Format the SD memory card with the volume			
	label "ABCDEFG."			
	JIABCDEFG			
Description	n This command is valid on products with SD			
	memory card (/EM1 option).			
LI	Saves setup data.			
Syntax	LI p1 <terminator></terminator>			
,	p1 File name (alphanumeric and symbols, up to			
	17 characters, no extension)			
Example	Save Setting mode setup data and Basic Setting			
	mode setup data to a file named SETFILE2.			
	LISETFILE2			
Description	• This command is valid on products with SD			
	memory card (/EM1 option).			
	The following characters cannot be used.			
	V:_?"<>{ }~^*			
LO	Loads setup data for Setting			
	mode.			
Syntax	L0 p1 <terminator></terminator>			
, ·····	p1 File name (alphanumeric and symbols, up to			
	17 characters, no extension)			
Example	Load the Setting mode setup data from a setup			
	file named SETFILE1.			
	LOSERFILE1			
D :	This second is called an analysis with OD			

Description This command is valid on products with SD memory card (/EM1 option).

YO Loads setup data for Setting mode including those of Basic Setting mode.

Syntax YO p1, p2<Terminator>

- p1 File name (alphanumeric and symbols, up to 17 characters, no extension)
- p2 Settings to load (0, 1)
 - 0 Settings of Basic Setting mode1 Settings of Basic Setting mode

and Setting mode

- Example Load the settings of Basic Setting mode from a file named CONFIG1.
- Description This command is valid on products with SD memory card (/EM1 option).

<u>UY</u> Stops the record position adjustment.

 Syntax
 UY pl<terminator>

 p1
 Fixed to 0.

 Query
 UY?

 Example
 Stop the record position adjustment.

 UY0
 UY0

 Description
 Returns the execution status of the record position adjustment in response to a query.

UA Adjusts the recording position.

Pen Model

Syntax UA p1,p2,p3<Terminator>

0: Stopped, 1: In progress

- p1 Select the position (Zero, Full)
- p2 Pen number (1 to 4)

pЗ	Adjusts the recording position.				
	\sim	Chart paper: 100 mm	Chart paper: 180mm		
	Zero	0 to 70	0 to 180		
	Span	-45 to 45	-165 to 165		
		(3026 reference)	(5447 reference)		

The	unit	is	1/30	mm

```
Query UA[p1[,p2]]?
```

Dot Model

Syntax UA p1, p2<Terminator>

- p1 Select the position (Zero, Full, Hysteresis)
- p2 Adjusts the recording position.

\sum	Chart paper: 100 mm	Chart paper: 180mm	
Hysteresis	-7 to 7	-7 to 7	
Zero	0 to 15	0 to 50	
Span	-30 to 30 (1000 reference)	-50 to 50 (1800 reference)	
The unit is dots (0.1 mm).			

Query UA[p1]?

Description To end recording position adjustment, execute UY0. Otherwise, you will not be able to change the operation mode.

4.7 Output Commands

BO	Sets the byte output order.			
Syntax	B0 p1 <terminator></terminator>			
	p1 Byte order			
	0 Outputs the data MSB first.			
	1 Outputs the data LSB first.			
Query	BO?			
Example	Output the data MSB first.			
	BOO			
Description	This command applies to the byte order of			
	numerical data during BINARY output.			
CS	Sets the checksum (/C3 option).			
Syntax	CS p1 <terminator></terminator>			
	p1 Use/Not use the checksum			
	0 Not use			
	1 Use			
Query	CS?			
Example	Use the checksum.			
	CS1			
Description	This command can be used only on the RS-			
	422A/485 communication interface.			
<u>IF</u>	Sets the status filter.			
Syntax	IF p1,p2 <terminator></terminator>			
	p1 Filter values for status information numbers			
	1 to 4			
	(0.0.0.0 to 255.255.255.255)			
	p2 Filter values for status information numbers			
	5 to 8			
	(0.0.0.0 to 255.255.255.255)			
Query	IF?			
Example	Enable bit 0 of status information 1, bit 1 of			
	information 2, bit 2 of information 3, bit 3 of			
	information 4, bit 4 of information 5, bit 5 of			
	information 6, bit 6 of information 7, and bit 7 of			
	information 8.			
Description	 IF8.4.2.1, 128.64.32.16 For details, see chapter 6. 			
Description				

Description • For details, see chapter 6. • p2 can be omitted.

In	itialization of BO/CS/IF Command Settings
٠	For serial communications
	Settings entered using the BO/CS/IF commands revert to their
	initial values when the recorder is reset (when the recorder is
	power cycled, or the user exits the basic setting mode with the
	YE command).
	Byte output order, checksum: 0
	• Status filter: 255.255.255.255
	If the recorder is reset, you must restore these settings.
•	For Ethernet communications
	Settings entered using the BO/IF commands revert to their
	initial values when the connection to the recorder is cut. After
	reconnecting the recorder, you must reenter the settings.

p= 00.11

4.7 Output Commands

<u>FE</u>	Outputs decimal point position, unit information, and setup data.	p3 Last output channel number Example Outputs the most recent periodic printout data of
Syntax	FE p1, p2, p3 <terminator> p1 Output data type 0 Setup data of Setting mode 1 Decimal point position and unit</terminator>	channel 01 to 04. FYInst, 01, 04 Description Tlog1 and Tlog2 are valid on models with the computation function (/M1 option).
Example Descriptior	 information 2 Setup data of Basic Setting mode 4 Setting data file p2 First output channel number p3 Last output channel number Output the setup data of the Setting commands of channel 01 through 04. FE0, 01, 04 n • Be sure to set p2 and p3 so that p3 is greater than or equal to p2. • The settings of p2 and p3 are valid when p1 = 0, 1, or 2. • The setting data file can be viewed using the configuration software. 	FF Outputs the FIFO data. Syntax FF p1, p2, p3, p4 <terminator> p1 Operation type GET Output the data starting from the next to the previous read position RESEND Retransmit the previous output RESET Set the read position (block) to the most recent acquire position (block) GETNEW Output the most recent data p2 First output channel number p3 Last output channel number p4 The upper limit of number of blocks that are to be loaded</terminator>
<u>FD</u>	Outputs the most recent measured/computed data.	Pen model 1 to 240
Syntax	 FD p1, p2, p3<terminator></terminator> p1 Output data type Output the most recent measured/ computed data in ASCII format Output the most recent measured/ computed data in BINARY format p2 First output channel number p3 Last output channel number 	Dot model 1 to 60 If the measured/computed data is less than the specified number of blocks, only the available data is transmitted. Example Output two blocks of FIFO data from channel 01 to computation channel 0P. FFGET, 01, 0P, 2
Example	Output the most recent measured/computed data from channel 01 to 04 in ASCII format.	On the µR10000 dot model, data from channels 01 to 06 and computation channels 0A to 0P will be output.
Description	 FD0, 01, 04 n • The most recent measured/computed data indicates the most recent measured/computed data when the recorder receives the FD command. Be sure to set p2 and p3 so that p3 is greater than or equal to p2. 	 As in this example, channel range can span across measurement channels and computation channels. Description • The FIFO buffer is of a circular type which overwrites from the oldest data when it is full. The FR command is used to set the acquiring interval.
<u>FY</u>	Outputs the statistical computation results.	 There are two FIFO data output formats. Logging output (GET) Output the appointed number of blocks (p4)
Syntax	 FY p1, p2, p3<terminator></terminator> p1 Output data type Inst Output the most recent periodic printout data (instantaneous value) Report Output the statistical calculation data of periodic printout (report data) Tlog1 Output the data at the most recent timeout of TLOG timer 1 Tlog2 Output the data at the most recent timeout of TLOG timer 2 p2 First output channel number	Output the specified number of blocks (p4) of FIFO data starting from the next to the previous read position (block). Make sure to read the data within the following buffer period to prevent data dropouts. Pen model FIFO buffer length 240 blocks Maximum buffer period 240 intervals Dot model FIFO buffer length 60 blocks Maximum buffer period 60 intervals Newest value output (GETNEW) Output the specified number of blocks (p4) of FIFO data back starting from the recent

acquire position (block).

- Parameters p2, p3, and p4 are valid when p1 is set to GET or GETNEW.
- If p4 is omitted, all the data of all blocks acquired in the FIFO buffer are output.
- Be sure to set p2 and p3 so that p3 is greater than or equal to p2.
- · For the output flow of FIFO data, see appendix 4.

IS Outputs status information.

Syntax IS p1<terminator>

- p1 Output status information (0, 1)
 - 0 Output status information entries 1 to 4.
 - Output status information entries 1 to 8. 1
- Example Output status information.

IS0

- Description The output status can be masked using the status filter (IF command).
 - · For details on status information, see chapter 6.

FU Outputs user information.

- Syntax FU p1<terminator>
 - p1 Output user information (0)
- Example Output user information.

FUO

Description Outputs the information of the user currently connected to the recorder.

RS-422A/485 Dedicated 4.8 Commands

<u>ESC O</u>	Opens the instrument.			
	The ASCII code of ESC is 1BH.			
Syntax	ESC 0 p1 <terminator:cr+lf></terminator:cr+lf>			
	p1 Instrument address (01 to 32)			
Example	Open the instrument at address 01.			
	ESC 001			
Description	Specifies the address of the instrument with			
	which to communicate.			
	Only one instrument can be opened at any			
	given time.			
	- When an instrument is opened with the \ensuremath{ESC}			
	O command, any other instrument that is			

- currently open is automatically closed. When this command is received correctly, the recorder transmits the data "ESC 0 xx" (xx: Instrument's address). For the description of the response, see page 5-5.
- Use CR+LF for the terminator. LF cannot be used.

ESC C Closes the instrument.

	The ASCII code of ESC is 1BH.
Syntax	ESC C p1 <terminator:cr+lf></terminator:cr+lf>
	p1 Instrument address (01 to 32)
Example	Close the instrument at address 01.
	ESC C01
Description	Clears the current connection with the
	instrument.
	When this command is received correctly, th
	recorder transmits the data "ESC C xx" (xx:
	Instrument's address). For the description of
	the response, see page 5-5.

• Use CR+LF for the terminator. LF cannot be used

4

the

of

4.9 Maintenance/Test **Commands** (Available when using the maintenance/ test server function via Ethernet communications)

close **Disconnects the connection** between other instruments. alaga n1 n2 m2 terminator

Syntax	close,p1,p2:p3 <terminator></terminator>		
	p1	Port on the recorder side (0 to 65535)	
	p2	IP address on the PC side	
		(0.0.0.0 to 255.255.255.255)	
	pЗ	Port on the PC side (0 to 65535)	
Example	clc	se,34159,192.168.111.24:1054	
	ΕO		
Description	This	s command cannot be used to disconned	
	a server port. Also, it cannot disconnect the		
	roce	order being operated. Use the quit comm	

ct recorder being operated. Use the quit command for this purpose.

            Keepalive check cycle.
         TCP: connects
            Total number of connections established.
```

TCP: closed

Total number of dropped connections.

TCP: timeoutdrop

Total number of dropped connections due to TCP retransmission timeout. When the transmitted packet (the unit of transmitted data) is not received, the packet is automatically retransmitted at a predetermined time interval. If the packet is not received after 14 retransmissions, timeout occurs and the connection is dropped.

TCP: keepdrops

Total number of dropped connections due to TCP keepalive timeout.

TCP: sndtotal

Total number of transmitted packets.

TCP: sndbyte

Total number of transmitted bytes.

TCP: sndrexmitpack Total number of retransmitted packets.

- TCP: sndrexmitbyte
 - Total number of retransmitted bytes.
- TCP: rcvtotal

Total number of received packets.

TCP: rcvbyte

Total number of received bytes.

DLC: 16 collisions Number of collision incidents. A collision occurs when two or more instruments on the network attempt to transmit simultaneously. The tendency for collisions to occur increases when the network is congested. 16 collisions would mean 16 consecutive

collision incidents.

<u>quit</u> Disconnects the connection of the instrument being operated.

Syntax quit<terminator>

4.10 Instrument Information Output Commands (Available when using the instrument information server function via Ethernet communications)

The instrument information server function interprets one UDP packet to be one command and returns a single packet (containing the recorder's information) in response to the command.

Port number	34264/udp	
	(see section 2.1)	
Transfer data	ASCII	
Received buffer length	128	
Transmit buffer length	512	
Maximum number of parameters	32	

In the command packet, parameters corresponding to the desired information are placed one after another.

Parameter	Description
serial	Outputs the serial number.
host	Outputs the host name (the host name specified
	in section 2.3).

- ip Outputs the IP address (the IP address specified in section 2.3).
- Example Query the IP address and host name. (Of the two frames below, the top frame represents the command packet, the bottom frame represents the response packet.)

ip host
EA
ip = 192.168.111.24
host = ABC
EN

Description • Separate each parameter with one or more blanks (space, tab, carriage return, line feed).

- Parameters are not case sensitive.
- Undefined parameters are ignored.
- Parameters beyond the 32nd parameter are ignored.

4

Blank

5.1 Response Syntax

The following table shows the types of responses for various commands described in the previous chapter.

The recorder returns a response (affirmative/negative response) to a command that is separated by a single terminator. The controller should follow the one command to one response format.

Function	Command		Response	
		Command Type	Affirmation	Negation
Setting/Measurement	Setting command		Affirmative	Single negative
server	Basic sett	Basic setting command		
	Control co	Control command		response or
	Output command	Setup, measurement, and computation data output	ASCII output	Multiple negative
			BINARY output	
		RS-422A/485 dedicated	Dedicated response	No response
Maintenance/Test Server	See sectio	See section 4.9.		
Instrument Information serve	See section 4.10.			

Note ____

The "CRLF" used in this section denotes a terminator.

Affirmative Response

When the command is processed correctly, an affirmative response is returned.

- Syntax
 - E0*CRLF*
- Example

ΕO

Single Negative Response

When the command is not processed correctly, a single negative response is returned.

• Syntax

E1_nnn_mmm ·	·mCRLF
nnn	Error number (001 to 999)
mmm · · ·m	Message (variable length, one line)
_	Space

• Example

E1 001 "System error"

Multiple Negative Responses

- If there is an error in any one of the multiple commands that are separated by sub delimiters, multiple negative responses are returned.
- The response is generated for each erroneous command.
- If there are multiple commands that have errors, the negative responses are separated by commas.
- The error position number is assigned to the series of commands in order starting with "1" assigned to the first command.

Syntax		
E2_ee:nn	n <i>CRLF</i>	(When there is only one error)
E2_ee:nnn,ee:nnn,···,ee:nnn <i>CRLF</i>		(When there are multiple errors
ee	Error position (01 to 10)	
nnn	Error number (001 to 999)	
_	Space	

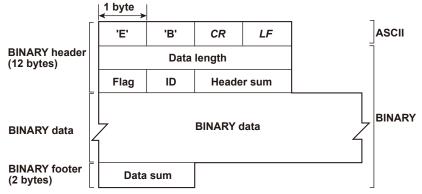

• Example E2 02:001

ASCII Output

- The following types of ASCII data are available. For the data formats, see section 5.2. Setting data, basic setting data, decimal place/unit information, measured/computed data, report data generated by the periodic printout, status information, and user information
- Syntax EACRLFCRLFCRLF ENCRLF

BINARY Output

Conceptual Diagram

• EBCRLF

Indicates that the data is BINARY.

Data Length

The byte value of "flag + identifier + header sum + BINARY data + data sum."

Header Sum

The sum value of "data length + flag + identifier."

• BINARY Data

For the output format of various data types, see section 5.3.

Data Sum

The sum value of "BINARY data."

Note

The data length of the BINARY header section is output according to the byte order specified with the BO command.

•	FI	lac

Flag				
Bit	Name (Abbreviation)	Flag	Flag	Meaning of the Flag
		0	1	
7	BO	MSB	LSB	Output byte order
6	CS	No	Yes	Existence of a checksum
5	_	_	-	
4	_	_	-	
3	_	-	-	
2	_	-	-	
1	-	_	-	
0	Reserved	-	-	Fixed to 1.

- When the BO flag is "0," the MSB is output first. When the BO flag is "1," the LSB is output first.
- If the check sum is enabled (parameter = 1) using the CS command parameter, each sum value is inserted in the header sum and data sum sections in the "Conceptual Diagram" on the previous page. If the check sum is disabled (parameter = 0), a zero is inserted in the header sum and data sum sections. For a sample program that calculates the sum value, see "Calculating the Sum Value" on the next page.
- The bits that have "-" for the flag and flag are not used. The value is undefined.

• Identifier

Binary Data Type	Format
Undefined file	_
Measured/computed data	Section 5.3
FIFO data	Section 5.3
Setup data file	Undisclosed
	Undefined file Measured/computed data FIFO data

- The table above shows the different types of BINARY Data.
- Measured/computed data can be output using the FD command.
- FIFO data can be output using the FF command.
- The setup data file can be output using the FE command. The setup data file can be loaded in the cofiguration software.
- The identifier section in the "Conceptual diagram" on the previous page contains the ID number shown above.

Note.

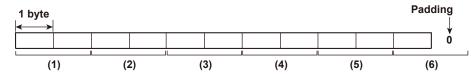

BINARY data that are not indicated in the above table are considered undefined files.

Calculating the Sum Value

If you set the parameter of the CS command to "1 (enabled)," the checksum value is output only during serial communications. The check sum is the same as that used in the TCP/IP and is derived according to the following algorithm.

Buffer on Which the Sum Value Is Calculated

- For the header sum, it is calculated from "data length + flag + identifier" (fixed to 6 bytes).
- For the data sum, it is calculated from "BINARY data."

If the data length of the buffer is odd, a "0" is padded so that it is even. (1) through (6) are summed as unsigned two-byte integers (unsigned short). If the digit overflows a "1" is added. Finally, the result is bit-wise inverted.

Sample Program

The sum value is determined using the following sample program, and the calculated result is returned. The sum determined by the sample program can be compared with the header sum of the output BINARY header section and the data sum of the output BINARY footer section.

```
/*
* Sum Calculation Function (for a 32-bit CPU)
* Parameters buff: Pointer to the top of the data on which the sum is calculated
             len: Length of the data on which the sum is calculated
* Return value:
                  Calculated sum
*/
int cksum(unsigned char *buff, int len)
{
  unsigned short *p;
                            /* Pointer to the next two-byte data word in the buffer
                            that is to be summed. */
  unsigned int csum; /* Checksum value */
  int i;
  int odd;
  csum = 0;
                            /* Initialize. */
  odd = len%2;
                            /* Check whether or not the number of data points is
                            even. */
                            /* Determine the number of data points using a "short"
  len >>= 1;
                            data type. */
  p = (unsigned short *)buff;
  for(i=0;i<len;i++)</pre>
                            /* Sum using an unsigned short data type. */
    csum += *p++;
  if(odd){
                            /* When the data length is odd */
  union tmp{
                            /* Pad with a 0, and add to the unsigned short data.
                            */
  unsigned short s;
  unsigned char c[2];
  }tmp;
  tmp.c[1] = 0;
  tmp.c[0] = *((unsigned char *)p);
  csum += tmp.s;
  if((csum = (csum & 0xfff) + ((csum>>16) & 0xffff)) > 0xffff)
                            /* Add the overflowed digits */
  csum = csum - 0xffff; /* If the digit overflows again, add a 1. */
  return((~csum) & Oxffff); /* bit inversion */
}
```

RS-422A/485 Dedicated Commands and Responses

The following table shows dedicated commands for the RS-422A/485 interface and their responses.

sponses.		
Command Syntax	Meaning	Response
ESC Oxx CRLF	Open the instrument.	 Response from the instrument with
		the specified address
		ESC Oxx CRLF
		 No response when the instrument with the specified address does not exist*
ESC Cxx CRLF	Close the instrument.	Response from the instrument with the specified address
		ESC Cxx CRLF
		 No response when the instrument with the specified address does not exist*

The causes that the condition become "The instrument with the specified address does not exist" is such as a command error, the address not matching that of the instrument, the instrument is not turned ON, and the instrument not being connected via the serial interface.

- The "xx" in the table indicates the instrument's address. Specify the address that is assigned to the instrument from 01 to 32.
- Only one instrument can be opened at any one time.
- When an instrument is opened with the ESC O command, all commands on the instrument become active.
- When an instrument is opened with the ESC O command, any other instrument that is open is automatically closed.
- Use CR+LF for the terminator. LF cannot be used.

Note -

The ASCII code of ESC is 1BH.

5.2 Output Format of ASCII Data

The following types of ASCII data are available.

- Setting data/Basic Setting data
- Decimal point position/unit information
- · Measured/computed data
- · Report data generated by the periodic printout
- Status information
- User information

Note _

The "CRLF" used in this section denotes a terminator.

Setting/Basic Setting data

- The FE command (FE0 or FE2) is used to output the data.
- The setting/basic setting data are output in the order of the listed commands in the table in section 4.2, "A List of Commands." However, the setting information for the following commands is not output.
 - Setting commands SD, CM, and FR
 - Basic Setting commands
 YE and XE
- The output format of the setting/basic setting data is the same as the syntax of each command.
- Some commands are output in multiple lines. (Example: Commands that are specified for each channel.)
- Syntax

The two-character command name and the succeeding parameters are output in the following syntax.

EACRLF ttsss···sCRLF ENCRLF

> tt Command name (SR, SA•••, XA, XI•••) sss····s Setting, basic setting data (variable length, one line)

• Example

```
EA
SR01,VOLT,20mV,0,20
SR02,VOLT,20mV,0,20
.....EN
```

Decimal Point Position/Unit Information

- The FE command (FE1) is used to output the data.
- **Syntax** • The data is output for each channel in the following syntax. EACRLF s kccuuuuuu, pp*CRLF* ENCRLF Data status (N, D, S) s N: Normal D: Differential input S: Skip (When the input range is set to SKIP for a measurement channel or when the channel is turned OFF for a computation channel) Channel type k 0: Measurement channel A: Computation channel СС Channel number µR10000: 01 to 06, 0A to 0P µR20000: 01 to 24, 0A to 1P uuuuuu Unit information (6 characters, left-justified) mV___: mV V____: V ^C __: °C xxxxxx: (User-defined character string) Decimal point position (00 to 04) pp No decimal (00000) for 00. One digit to the right of the decimal (0000.0) for 01. Two digits to the right of the decimal (000.00) for 02.

Three digits to the right of the decimal (00.000) for 03.

- Four digits to the right of the decimal (0.0000) for 04. _____ Space
- Example
 - EA N 001mV ,01 N 002mV ,01 EN

Measured/computed Data

- The FD (FD0) or FY (FYInst, FYTlog1, or FYTlog2) command is used to output the data.
- Syntax

The measured/computed data are output in the following syntax along with the date and time information for each channel

EACRLF DATE_yy/mo/ddCRLF TIME_hh:mi:ss.mmmt_S1S2S3S4S5S6CRLF s_kcca1a2a3a4uuuuuuf1dddddEf2ppCRLF

```
ENCRLF
```

λλ	Year (00 to 99)
mo	Month (01 to 12)
dd	Day (01 to 31)
hh	Hour (00 to 23)
mi	Minute (00 to 59)
SS	Second (00 to 59)
mmm	Millisecond (000 to 999. A period is placed between seconds and
	milliseconds.)
t	'S'(=summer) or ' ' space(=winter)
S1S2S3S4S5S6	Data status
	Takes on the values below for the FYTlog1 and FYTlog2
	commands. For all other cases, they are all spaces.
S_1	Time change during TLOG computation: T (occurred) or space (not
	occurred)
S2	Power OFF and ON during TLOG computation: P (occurred) or
	space (not occurred)
S3	Data reset during the TLOG computation: R (occurred) or space
	(not occurred)
$S_{4}S_{5}S_{6}$	All spaces
S	Channel data status (N, D, S, O, B, E)
	N: Normal
	D: Differential input
	S:Skip
	O: Over
	B: Burnout
	E: Error
k	Channel type

5.3 Output Format of BINARY Data

This section describes the output format of the BINARY data that is disclosed. For the BINARY output format, see "BINARY Output" on page 5-2. For other BINARY data types, see "Identifier" on page 5-3.

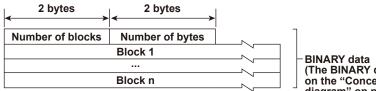

The measured data is output using signed 16-bit integer; the computed data is output using signed 32-bit integer. These integers can be understood as physical values by adding the decimal point and the unit.

/ /	y	
BINARY Value	Decimal Place Code	Physical Value (Measured Value)
10000	0	10000
10000	1	1000.0
10000	2	100.00
10000	3	10.000
10000	4	1.0000

Typical Examples to Obtain Physical Values

Measured/Computed Data and FIFO Data

- The FD (FD1) command is used to output the most recent measured/computed data.
- The FF (FFGET, FFRESEND, and FFGETNEW) command is used to output the FIFO data. The decimal point position and unit can be determined using the FE command.
- The ID number of the output format is 1. See "Identifier" on page 5-3.

BINARY data (The BINARY data section) on the "Conceptual diagram" on page 5-2.)

Number of Blocks

This is the number of blocks.

Number of Bytes

This is the size of one block in bytes.

• Block

1 byte	1 byte	1 byte	1 byte	1 byte	1 byte	2 bytes	1 byte	1 byte
Year	Month	Day	Hour	Minute	Second	Millisecond	(Reserved)*	Flag
Measured/ Computed	Channel	A2A1	A4A3	Measur	ed data		,	
					•			
Measured/ Computed	Channel	A2A1	A4A3		Compu	ted data]	
				-				
				`	4	oytes		

The sections indicated as (Reserved) are not used. The value is undefined.

Flag

The meanings of the flags are given on the table below. The flags are valid during FIFO data output. The flags are undefined for other cases.

Bit	Flag	Flag	Meaning of the Flag
	0	1	
6	_	_	
5	_	_	
4	_	_	
3	_	_	
2	No	Yes	Indicates that the decimal place or unit information was changed during measurement.
1	No	Yes	Indicates that the FIFO acquiring interval was changed during measurement.
0	No	Yes	Indicates that the internal process took too much time (computation, for example) and that FIFO dropout occurred.

The bits that have "--" for the flag column are not used. The value is undefined.

Block Member

Name	BINARY Value
Year	0 to 99
Month	1 to 12
Day	1 to 31
Hour	0 to 23
Minute	0 to 59
Second	0 to 59
Millisecond	0 to 999
DST	1 (=summer) or 0 (=winter)
Measurement, computation	00H: measurement, 80H: computation
Channel	µR10000: 01 to 06 and 31 to 42
	µR20000: 01 to 24, 31 to 54
Alarm status*	
A1 (Bit 0 to 3)	<mark>≺ 1 byte 1 byte </mark>
A2 (Bit 4 to 7)	0 to 8 A2 (Level 2) A1 (Level 1) A4 (Level 4) A3 (Level 3)
A3 (Bit 0 to 3)	
A4 (Bit 4 to 7)	
Measured data	0 to FFFH
Computed data	0 to FFFFFFFH

BINARY value 0 to 8 is entered in the upper and lower 4 bits of a byte (8 bits) for the alarm status. The binary values 0 to 8 correspond to H (high limit alarm), L (low limit alarm), h (difference high-limit alarm), I (difference low-limit alarm), R (high limit on rate-of-change alarm), r (low limit on rate-of-change alarm), r (low limit on rate-of-change alarm), and t (delay low limit alarm) as follows:

0: no alarm, 1: H, 2: L, 3: h, 4: l, 5: R, 6: r, 7: T, and 8: t.

• Special Data Value

The measured/computed data take on the following values under special conditions.

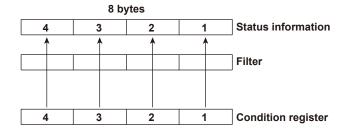

Special Data Value	Measured Data	Computed Data
+ Over	7FFFH	7FFF7FFH
– Over	8001H	80018001H
Skip	8002H	80028002H
Burnout (when "up" is set)	7FFAH	7FFF7FFH
Burnout (when "down" is set)	8006H	80018001H
Error	8004H	80048004H
Undefined	8005H	80058005H

Note.

The number of blocks, number of bytes, and measured/computed data are output according to the byte order specified with the BO command.

6.1 Status Information and Filter

The following figure illustrates the status information and filter on the recorder.

- When a status indicated on the following page is entered, the corresponding bit in the condition register is set to "1." The logical AND of the condition register and the filter becomes the status information.
- The IF command can be used to set the filter.
- The IS command is used to output the status information. Status information 1, 2, 5, and 6 are cleared when they are output. Status information 3, 4, 7, and 8 are not cleared when it is output, and remains at "1" while the event is occurring.
- If a status of a bit blocked by a filter occurs, status information 1, 2, 5, and 6 ignore the status. Status information 3, 4, 7, and 8 reflect the status and hold it.
- When multiple connections are up, filters can be specified for the individual connection. Therefore, the status information can be held for each connection.

6.2 The Bit Structure of the Status Information

The following four groups of status information are output in response to a status information output request using the IS command. For the output format, see "Status Information" in section 5.2, "Output Format of ASCII Data."

Status Information 1

Bit	Name	Description
0	A/D conversion complete	Set to "1" when the A/D conversion of the measurement is complete.
1	_	-
2	Periodic printout timeout	Set to "1" when the periodic printout timer expires.
3	TLOG timeout	Set to "1" when the TLOG timer expires.
4	_	-
5	_	_
6	_	-
7	_	_

Status Information 2

Bit	Name	Description
0	Measurement drop	Set to "1" when the measurement process could not keep up.
1	Decimal point/unit information change	Set to "1" when the decimal point/unit information is changed.
2	Command error	Set to "1" when there is a command syntax error.
3	Execution error	Set to "1" when an error occurs during command execution.

Appendix 1 ASCII Character Codes

Command	Used for	Characters
SN	Unit	Alphanumeric characters, signs, and space
ST	Tag	Alphanumeric characters, signs, and space
SG	Message	Alphanumeric characters, signs, and space
YB	Host/Domain name	Alphanumeric characters and signs
YN	Domain suffix	Alphanumeric characters and signs
SO	Computing equation	Alphanumeric characters, signs, and space
-		

The table below contains the ASCII character codes of characters that can be used. The delimiter (,), sub delimiter (;), query symbol (?), terminator (CR+LF), and ESC characters are reserved. You cannot use them as parameter characters.

English

Note.

" μ ", " Ω ", "²", "³", and "^o" are assigned to character codes as follows: Characters in the parentheses are the characters assigned on the keyboard.

Lower Upper	0	1	2	3	4	5	6	7	8	9	Α	в	с	D	Е	F
0											LF			CR		
1												ESC				
2	SP			#		%			()	*	+	,	-		/
3	0	1	2	3	4	5	6	7	8	9	:	;				?
4	@	Α	В	С	D	Е	F	G	Н	Ι	J	Κ	L	Μ	Ν	0
5	Ρ	Q	R	S	Т	U	V	W	Х	Υ	Ζ				0	
6		а	b	С	d	е	f	g	h	i	j	k	I	m	n	0
7	р	q	r	s	t	u	۷	w	х	у	Z	μ	Ω	2	3	

μ: 7BH ({), Ω: 7CH (|), ²: 7DH (}), ³: 7EH (~), °: 5EH (^)

German and French

Note _

" Ω " is assigned to character code as follows: The character in the parentheses is the character assigned on the keyboard.

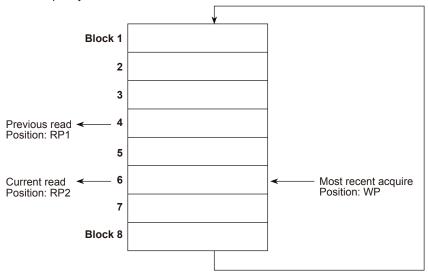

Ω: 7CH (|)

Lower Upper	0	1	2	3	4	5	6	7	8	9	A	в	с	D	Е	F	
0											LF			CR			
1												ESC					
2	SP			#		%			()	*	+	,	-		1	
3	0	1	2	3	4	5	6	7	8	9		;				?	
4	@	Α	В	С	D	Е	F	G	Н	Ι	J	K	L	Μ	Ν	0	
5	Р	Q	R	S	Т	U	V	W	Х	Υ	Ζ				١		
6		а	b	с	d	е	f	g	h	i	j	k	Ι	m	n	ο	
7	р	q	r	s	t	u	v	w	х	У	z		Ω				
Α																	
в	0		2	3		μ											
С					Ä			Ç				Ë				Ϊ	Only German
D							Ö						Ü			ß	Only French
Е	à		â		ä			ç	è	é	ê	ë			î	ï	
F					Ô		Ö			ù		û	ü				

App Appendix

Appendix 2 Output Flow of FIFO Data

The recorder has a dedicated internal memory for outputting measured/computed data. This memory is structured as a FIFO (First-In-First-Out). Measured/computed data are constantly acquired to the internal memory at the specified acquiring interval (FIFO acquiring interval, set with the FR command). By using this function, it is possible to read measured/computed data that have been saved at the specified intervals regardless of the frequency at which the PC periodically reads the measured/computed data.

The following example shows the case when the acquiring interval is 1 s and the buffer capacity is for 8 intervals.

· Acquiring of the measured/computed data

- The measured/computed data are acquired to the internal memory at 1 s intervals.
- Measured/computed data are acquired to blocks 1 through 8 in order. After acquiring to block 8, the next acquiring operation returns to block 1.
- Reading the measured/computed data (FF GET command is used, logging output)

Outputs the data from the next to the previous read position (RP1) to the most recent acquire position (WP).

In this example, more than 2 s has elapsed from the previous read operation. Therefore, data in blocks 5 and 6 are output.

• Reading the measured/computed data (FF GETNEW command is used, output of the most recent value)

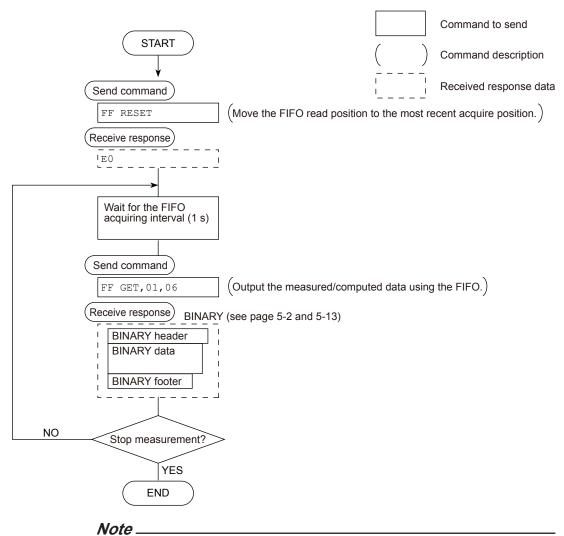

Output the specified number of blocks of FIFO data back starting from the recent acquire position (WP).

In this example, if you specify the number of blocks to "5," data in blocks 2 to 6 are output.

The buffer capacity varies depending on the model.

Pen model:	240 intervals (30 s at an acquiring interval of 125 ms)
Dot model:	60 intervals (60 s at an acquiring interval of 1 s)

Example in which the FIFO acquiring interval on the recorder is set to 1 s and the measured data from channel 01 to 06 are continuously output (logging function)

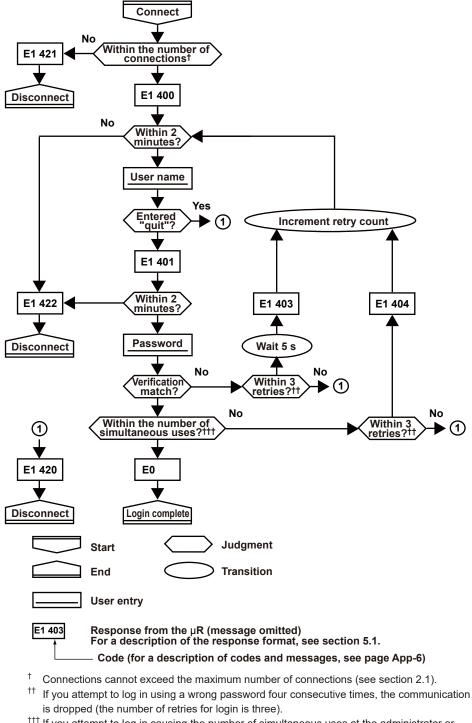

- The FIFO acquiring interval must be set using the FR command beforehand.
- The FIFO acquiring interval applies to both serial and Ethernet communications.

Appendix 3 Login Procedure

When using the Setting/Measurement server or the Maintenance/Test server via the Ethernet interface (/C7 option), you must log into the recorder from the PC. If you complete the procedure successfully up to login complete in the following figure, the commands in chapter 4 become functional.

When using the login function

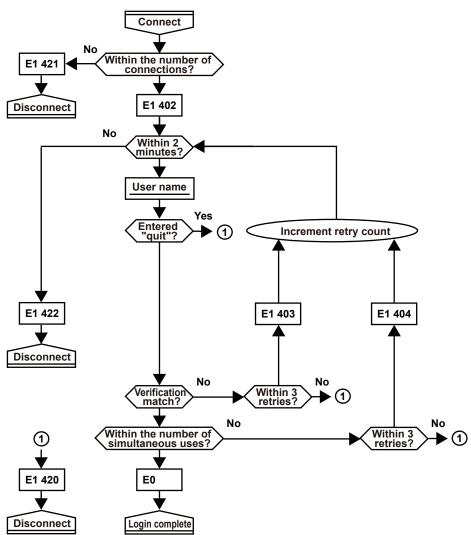

⁺⁺⁺ If you attempt to log in causing the number of simultaneous uses at the administrator or user level to be exceeded (see section 2.1) four consecutive times, the communication is dropped (even if the password is correct).

When not using the login function

Login as "admin" or "user."

- The user name "admin" can be used to login to the recorder as an administrator.
- The user name "user" can be used to access the recorder as a user.

Appendix 4 A List of Error Messages

There are cases in which error codes and messages are displayed on the screen during operation. The error messages and their description are listed below.

Setting Errors

Code	Message	Explanation/Countermeasures
1	System error.	Contact your nearest YOKOGAWA dealer.
2	Incorrect date or time setting.	Check the setting.
3	A disabled channel is selected.	The channel does not exist.
4	Incorrect function parameter.	Incorrect communication parameter.
5	The input numerical value exceeds the set range.	_
6	Incorrect input character string.	The entered character cannot be used.
7	Too many characters.	-
8	Incorrect input mode.	Incorrect range mode (Volt, TC, Scale, etc.) setting.
9	Incorrect input range code.	Incorrect range type (2 V, R, PT100, etc.) setting.
10	Format error.	Incorrect character string format.
11	Range settings are not same within the selected channels.	Channels whose range differs cannot be set simultaneously.
12	An invalid characters.	Contains an invalid character.
13	Ref. CH error.	Specify a channel whose range is set to voltage, TC, or RTD for the reference channel.
15	Too many characters for printout.	Too many characters in the message printout including measured/computed values.
16	Too many characters for message.	Cannot enter a setting that exceeds the message string (16 characters).
21	Cannot set an alarm for a SKIPPED channel.	-
22	The upper and lower span limits are equal.	This is not allowed.
23	The upper and lower scale limits are equal.	This is not allowed.
24	The lower span limit is greater than the upper span limit.	-
25	The lower scale limit is greater than the upper scale limit.	-
26	Bias cannot be set to the SKIPPED channel.	-
27	Bias cannot be set to the DI channel.	-
30	The partial boundary value exceeds the range of the span.	_
31	Partial is invalid on the SKIPPED channel.	-
35	The upper and lower limits of the printing zone are equal.	Set the rightmost value of the zone – the leftmost value ≥ 5 mm.
36	The lower limit of the printing zone is greater than the upper limit.	Set the rightmost value of the zone – the leftmost value ≥ 5 mm.
37	The printing zone is narrower than the minimum width (5 mm).	Set the rightmost value of the zone – the leftmost value ≥ 5 mm.
38	Partial is invalid on the DI channel.	-
39	The bias and the calibration cannot be used simultaneously.	-
40	Datum value(1 >= 2)	Set the measured value of the first point less than that of the second point in the calibration correction.
41	Datum value(n-1 > n)	Set the measured value of the $n-1^{th}$ point less than or equal to that of the n^{th} point in the calibration correction.
42	Revise value(n-1 >= n)	Set the correction value of the $n-1^{th}$ point less than that of the n^{th} point in the calibration correction.
47	All items in DISP menu parameters are set to SKIP.	-
48	Start = Finish.	The DST start time and end time cannot be set to the same time.
49	Invalid or missing DST time settings.	Since the time gains one hour when the DST starts, the set- up time does not exist.
61	There is no channel specified by the MATH expression.	Set a computation channel.
62	MATH expression grammar is incorrect.	Enter the equation correctly.
63	MATH expression sequence is incorrect.	Enter the equation correctly.

Code	Message	Explanation/Countermeasures
64	MATH upper and lower span values are equal.	This is not allowed.
70	MATH constant description is incorrect.	Incorrect computation constant syntax.
71	The range of the MATH constant is exceeded.	-
72	MATH channel is turned off	_
81	All space or 'quit' string cannot be specified.	_
86	The key-lock release password is incorrect.	Enter the correct password.
87	This key is locked.	-
91	Password is incorrect.	Enter the correct password.
100	IP address doesn't belong to class A, B, or C.	-
101	The result of the masked IP address is all 0s or 1s.	_
102	SUBNET mask is incorrect.	Set a correct subnet mask.
103	The net part of default gateway is not equal to that of IP address.	Set the correct default gateway.
151	This action is invalid during calculation.	-
160	This action is invalid during chart end.	_
161	This action is invalid during pen hold.	_
162	Cannot set an number for a skipped data.	-
163	This action is invalid during record.	-
164	This action is invalid during manual printing.	_
165	This action is invalid during list printing.	_
166	This action is invalid during setup list printing.	_
167	This action is invalid during chart feed.	_
169	This action is invalid during ribbon hold.	_
170	This action is invalid during priority remote record.	Recording stop via communications or key operation cannot be accepted under the current settings. Perform the Stop using the remote control function.
171	This action is invalid during batch.	Cannot enter Basic Setting mode during header printout (unti End printout is finished).
172	Action not executable while accessing SD card.	Cannot be executed while the SD memory card is being accessed.
173	Action not executable while data save is in progress.	Cannot be executed while data is being saved.
174	Action not executable while data replay is in progress.	Cannot be executed while data is replayed.
175	Ejecting SD card is not possible.	The SD memory card cannot be ejected currently. Try again later.
176	File already exists.	Unable to save because a file with the same name already exists. Change the file name.
177	File does not exist.	The specified file does not exist. Check the file name.
178	There is no SD card.	Insert the SD memory card properly.
179	Please acknowledge all active alarms.	Perform alarm acknowledge operation (alarm ACK).

Operation Errors

Code	Message	Explanation/Countermeasures
232	There is no available data.	There is no data for periodic printout or data for calculating TLOG when the timer expired.
233	SD card access error.	Unable to access the SD memory card. Check that the SD memory card is inserted properly, that there is enough free space, and that the card is not locked.
234	The file is damaged.	The file is corrupt.
235	The file is not supported.	Data replay is not possible because the model, option, or version is different.

Communication Errors

The messages from 390 to 422 can only be returned via communication, and are not displayed on the recorder.

Code	Message	Explanation/Countermeasures
300	Command is too long.	_
301	Too many number of commands delimited with ';'.	Keep the number of commands separated by sub delimiters under 10.
302	This command has not been defined.	_
303	Data request command can not be enumerated with sub-delimiter.	-

Appendix 4 A List of Error Messages

Code	Message	Explanation/Countermeasures
350	Command is not permitted to the current user level.	_
351	This command cannot be specified in the current mode.	-
352	The option is not installed.	-
353	This command cannot be specified in the current setting.	-
354	This command is not available during calculation.	_
390	Command error.	_
391	Delimiter error.	_
392	Parameter error.	_
393	No permission.	_
394	No such connection.	_
395	Use "quit" to close this connection.	Attempted to disconnect its own connection.
396	Failed to disconnect.	_
397	No TCP control block.	The control block of the specified connection cannot be found.
400	Input username.	_
401	Input password.	_
402	Select username from 'admin' or 'user'.	If the recorder is configured not to use the user name and password, use user names 'admin' or 'user'.
403	Login incorrect, try again!	_
404	No more login at the specified level is acceptable.	-
420	Connection has been lost.	-
421	The number of simultaneous connection has been exceeded.	-
422	Communication has timed-out.	_

Warning Messages

Code	Message	Explanation/Countermeasures
600	Initialized.	Settings and measured data have been initialized. If this message always appears when you turn the power off and then back on, contact your nearest YOKOGAWA dealer.
612	Some items not set.	Some of the settings could not be loaded because the model, the number of channels, options, or the like was different.
613	Less than 10% free space on the SD card.	The amount of free space on the SD memory card is low. Replace the SD memory card.
614	Less than 25 MB free space on the SD card.	The amount of free space on the SD memory card is low. Replace the SD memory card.

System Errors

Code	Message	Explanation/Countermeasures
902	RAM failure.	Contact your nearest YOKOGAWA dealer.
910	A/D error.	Contact your nearest YOKOGAWA dealer.
921	A/D calibration value error.	Contact your nearest YOKOGAWA dealer.
922	A/D calibration is in the wrong order.	Contact your nearest YOKOGAWA dealer.
930	Memory acquisition failure.	Contact your nearest YOKOGAWA dealer.
940	The ethernet module is down.	Contact your nearest YOKOGAWA dealer.
950	A/D number error.	Contact your nearest YOKOGAWA dealer.
951	EEPROM write error.	Contact your nearest YOKOGAWA dealer.
960	Ribbon error	Contact your nearest YOKOGAWA dealer.
961	Printer error	Contact your nearest YOKOGAWA dealer.
962	Plotter error	Contact your nearest YOKOGAWA dealer.
963	Pen 1 error	Contact your nearest YOKOGAWA dealer.
964	Pen 2 error	Contact your nearest YOKOGAWA dealer.
965	Pen 3 error	Contact your nearest YOKOGAWA dealer.
966	Pen 4 error	Contact your nearest YOKOGAWA dealer.
B5	(No messages)	Contact your nearest YOKOGAWA dealer.
B6	(No messages)	Contact your nearest YOKOGAWA dealer.
