Introduction

Thank you for purchasing the UT350/UT320 digital indicating controller.

How to Use the Manuals

Regarding This User’s Manual

(1) This manual should be provided to the end user. Keep an extra copy or copies of the manual in a safe place.

(2) Read this manual carefully to gain a thorough understanding of how to operate this product before starting operation.

(3) This manual describes the functions of this product. Yokogawa M&C Corporation (hereinafter simply referred to as Yokogawa) does not guarantee the application of these functions for any particular purpose.

(4) Under absolutely no circumstances may the contents of this manual, in part or in whole, be transcribed or copied without permission.

(5) The contents of this manual are subject to change without prior notice.

(6) Every effort has been made to ensure that the details of this manual are accurate. However, should any errors be found or important information be omitted, please contact your nearest Yokogawa representative or our sales office.
## Safety Precautions

The following symbol is indicated on the controller to ensure safe use.

---

**CAUTION**

This symbol on the controller indicates that the operator must refer to an explanation in the user’s manual in order to avoid the risk of injury or death of personnel or damage to the instrument. The manual describes how the operator should exercise special care to avoid electric shock or other dangers that may result in injury or loss of life.

The following symbols are used in the hardcopy user’s manuals and in the user’s manual supplied on the CD-ROM.

---

**NOTE**

Indicates that operating the hardware or software in a particular manner may damage it or result in a system failure.

---

**IMPORTANT**

Draws attention to information that is essential for understanding the operation and/or features of the controller.

---

## Regarding Force Majeure

Yokogawa M&C Corporation assumes no liability for any loss or damage, direct or indirect, caused by the use of or unpredictable defects of the product.
INTRODUCTION

1. INSTALLATION
   1.1 Model and Suffix Codes
   1.2 How to Install
   1.3 How to Connect Wires
   1.4 Hardware Specifications
   1.5 Terminal Wiring Diagrams

2. INITIAL SETTINGS
   2.1 Names and Functions of Front Panel Parts
   2.2 Setting PV Input Type (Setting First at Power-on)
   2.3 Changing PV Input Type
   2.4 Setting Control Output Type
   2.5 Changing Alarm Type
   2.6 Description of Multiple Setpoints and PID

3. OPERATIONS
   3.1 Monitoring-purpose Operating Displays Available during Operation
   3.2 Setting Target Setpoint (SP)
   3.3 Performing/Canceling Auto-tuning
   3.4 Setting PID Manually
   3.5 Setting Alarm Setpoints
   3.6 Selecting Target Setpoint Numbers (SP.NO)
   3.7 Switching between Run and Stop
   3.8 Switching between AUTO and MAN
   3.9 Manipulating Control Output in Manual Operation

4. TROUBLESHOOTING AND MAINTENANCE

Revision Information ......................................................................................... i
1. Installation

This chapter describes installation, wiring, and other tasks required to make the controller ready for operation.

1.1 Model and Suffix Codes

Before using the controller, check that the model and suffix codes match your order.

Check that the following items are provided:

- Digital indicating controller (of ordered model) ...................... 1
- Brackets (mounting hardware) ............................................. 1 pair
- Unit label .............................................................................. 1
- User’s Manuals .................................................................... 3 (A2 size)
- User’s Manual (Reference) (CD-ROM version) .................... 1
1.2 How to Install

**NOTE**

To install the controller, select a location where:

1. no one may accidentally touch the terminals,
2. mechanical vibrations are minimal,
3. corrosive gas is minimal,
4. temperature can be maintained at about 23°C and the fluctuation is minimal,
5. no direct radiant heat is present,
6. no magnetic disturbances are caused,
7. no wind blows against the terminal board (reference junction compensation element),
8. no water is splashed,
9. no flammable materials are around,

Never place the controller directly on flammable items or equipment.

If the controller has to be installed close to flammable items or equipment, be sure to provide shielding panels all around the controller, at least 150 mm away from every side; the panels should be made of either 1.43 mm-thick metal-plated steel plates or 1.6 mm-thick uncoated steel plates.

**NOTE**

Never touch the opening at the bottom of the case. It is to be used in the factory at shipping.

---

**Installation Position**

Install the controller at an angle within 30° from horizontal with the front panel facing upward. Do not install it facing downward. The position of right and left sides should be horizontal.
External Dimensions and Panel Cutout Dimensions

**UT350**

![Diagram of UT350 dimensions](image)

- General installation
- Side-by-side close installation

**UT320**

![Diagram of UT320 dimensions](image)

- General installation
- Side-by-side close installation

Unit: mm

“N” stands for the number of controllers to be installed. However, the measured value applies if N ≥ 5.
How to Install

Turn off the power to the controller before installing it on the panel because there is a possibility of electric shock.

CAUTION

After opening the mounting hole on the panel, follow the procedures below to install the controller:

1. Insert the controller into the opening from the front of the panel so that the terminal board on the rear is at the far side.
2. Set the brackets in place on the top and bottom of the controller as shown in the figure below, then tighten the screws of the brackets. Take care not to overtighten them.
1.3 How to Connect Wires

**CAUTION**
1) Before carrying out wiring, turn off the power to the controller and check that the cables to be connected are not alive with a tester or the like because there is a possibility of electric shock.
2) Wiring must be carried out by personnel who have basic electrical knowledge and practical experience.

**NOTE**
1) Provide power from a single-phase instrument power supply. If there is a lot of noise in the power line, insert an insulating transformer into the primary side of the line and use a line filter (recommended part: ZAC2205-00U from TDK) on the secondary side. As a countermeasure against noise, do not place the primary and secondary power cables close to each other.
2) For thermocouple input, use shielded compensating lead wires for wiring. For RTD input, use shielded wires that have low conductor resistance and cause no significant differences in resistance between the three wires. The cables to be used for wiring, terminal specifications, and recommended parts are as shown below.
3) Control output relays may be replaced. However, because they have a life of 100,000 times that of the resistance load, use auxiliary relays to turn on/off a load.
4) The use of inductance (L) loads such as auxiliary relays, motors and solenoid valves causes malfunction or relay failure; always insert a CR filter for use with alternating current or a diode for use with direct current, as a spark-removal surge suppression circuit, into the line in parallel with the load.
5) When there is possibility of being struck by external lightning surge, use the arrester to protect the instrument.

■ For DC Relay Wiring

![For DC Relay Wiring Diagram]

- UT350/UT320
- External DC power supply
- UT's contact
- Relay (Mount it directly to the relay coil terminal (socket).)
- Diode (Use one with a relay coil rating less than the UT's contact rating.)

■ For AC Relay Wiring

![For AC Relay Wiring Diagram]

- UT350/UT320
- External AC power supply
- UT's contact
- Relay (Mount it directly to the relay coil terminal (socket).)
- CR filter (Use one with a relay coil rating less than the UT's contact rating.)

1. Before attaching the terminal cover, bend the side with the groove inward as shown in Fig. A. Be careful not to bend it backwards. This not only marks it harder to attach the cover but will also weaken its hold.

2. Fit the holes on the top and bottom of the terminal cover the projections on the brackets (Fig. B) and lock in place. The figure right shows the attachment of a terminal cover to UT controller.
1.4 Hardware Specifications

PV Input Signals

- Number of inputs: 1 (terminals 11-12-13)
- Input type: Universal input system. The input type can be selected with the software.
- Sampling period: 250 ms
- Burnout detection: Functions at TC, RTD, standard signal (0.4 to 2 V or 1 to 5 V) Upscale, downscale, and off can be specified. For standard signal, burnout is determined to have occurred if it is 0.1 V or less.
- Input bias current: 0.05 μA (for TC or RTD b-terminal)
- Measurement current (RTD): About 0.13 mA
- Input resistance: 1 MΩ or more for thermocouple or mV input About 1 MΩ for DC voltage input
- Allowable signal source resistance: 250 Ω or less for thermocouple or mV input Effects of signal source resistance: 0.1 μV/Ω or less 2 kΩ or less for DC voltage input Effects of signal source resistance: About 0.01%/100 Ω
- Allowable wiring resistance: for RTD input Maximum 150 Ω/wire: Conductor resistance between three wires should be equal However, 10 Ω/wire for a maximum range of -150.0 to 150.0°C Wire resistance effect: ±0.1°C/10 Ω
- Allowable input voltage: ±10 V DC for thermocouple, mV, or RTD input ±20 V DC for DC voltage input
- Noise rejection ratio: 40 dB (50/60 Hz) or more in normal mode 120 dB (50/60 Hz) or more in common mode
- Reference junction compensation error: ±1.0°C (15 to 35°C) ±1.5°C (0 to 15°C, 35 to 50°C)
- Applicable standards: JIS, IEC, DIN (ITS-90) for thermocouples and RTD

Loop Power Supply

Supplies power to a two-wire transmitter.
(15 V DC: terminals 14-15; 24 V DC: terminals 21-22)
A resistor (10 to 250 Ω) connected between the controller and transmitter converts a current signal into a voltage signal, which is then read via the PV input terminal.
Supply voltage: 14.5 to 18.0 V DC, max. 21 mA (provided with a protection circuit against a field short-circuit); 21.6 to 28.0 V DC, max. 30 mA (only for models with 24 V DC loop power supply)
When using the 24 V DC loop power supply of the UT320, keep the operating ambient temperature between 0°C and 40°C.
Retransmission Output

Either PV, target setpoint, or control output is output. Either the retransmission output or the loop power supply can be used with terminals 14-15.

- Number of outputs: 1 (terminals 14-15)
- Output signal: 4-20 mA DC
- Load resistance: 600 Ω or less
- Output accuracy: ±0.3% of span under standard operating conditions (23±2°C, 55±10% RH, power frequency of 50/60 Hz)

Control Output

Universal output system, The output type can be selected with the software.

- Current output
  (Standard type: terminals 16-17; Heating/cooling type: Heating side: terminals 16-17; Cooling side: terminals 14-15)

Contact Inputs

- Purpose: Selection between target setpoints or Auto/Man modes, or for other purposes
- Number of inputs: 2
- Input type: Non-voltage contact or transistor open collector input
- Input contact rating: 12 V DC, 10 mA or more
• On/off determination: For non-voltage contact input, contact resistance of 1 kΩ or less is determined as “on” and contact resistance of 20 kΩ or more as “off.” For transistor open collector input, input voltage of 2 V or less is determined as “on” and leakage current must not exceed 100 μA when “off.”
• Minimum status detection hold time: About 1 second.

Contact Outputs
• Purpose: Alarm output, FAIL output, and others
• Number of outputs: 3
• Relay contact rating: 240 V AC/1 A or 30 V DC/1 A (COM terminal is common.) (FAIL output : 1b)

Display Specifications
• PV display: UT350: 4-digit, 7-segment red LED display, character height of 20 mm
  UT320: 4-digit, 7-segment red LED display, character height of 12 mm
• Setpoint display: 4-digit, 7-segment red LED display, character height of 9.3 mm (for both UT350 and UT320)
• Status indicating lamps: LEDs

Safety and EMC Standards
• Safety: Compliant with IEC1010-1: 1990 and EN61010-1: 1992
  Approved by CSA1010
  CSA1010 installation category (overvoltage category): CATII (IEC1010-1)
  Approved by UL508
• EMC standards: The instrument continues to operate at a measuring accuracy of within ±20% of the range during test.

Construction, Installation, and Wiring
• Construction: Only the front panel is dust-proof and drip-proof (protection class IP55)
  For side-by-side close installation the controller loses its dust-proof and drip-proof protection.
• Material: ABS resin and polycarbonate
• Case color: Black
• Weight: About 1 kg or less
• Dimensions:
  UT350 –96 (W) × 96 (H) × 100 (depth from panel face) mm
  UT320 –48 (W) × 96 (H) × 100 (depth from panel face) mm
• Installation: Panel-mounting type. With top and bottom mounting hardware (1 each)
• Panel cutout dimensions:
  UT350 –92×108 (W) × 92×108 (H) mm
  UT320 –45×106 (W) × 92×108 (H) mm
• Installation position: Up to 30° upward facing (not designed for facing downward)
• Wiring: M3.5 screw terminals (for signal wiring and power/ground wiring as well)
Power Supply Specifications

- Power supply: Rated voltage of 100 to 240 V AC (±10%), 50/60 Hz
- Power consumption: Max. 20 VA (8.0 W max.)
- Internal fuse rating: 250 V AC, 1.6A time-lug fuse
- Data backup: Non-volatile memory (can be written to up to 100,000 times)
- Withstanding voltage
  - Between primary terminals* and secondary terminals**: At least 1500 V AC for 1 minute (Note)
  - Between primary terminals* and grounding terminal: At least 1500 V AC for 1 minute (Note)
  - Between grounding terminal and secondary terminals**: At least 1500 V AC for 1 minute
  - Between secondary terminals**: At least 500 V AC for 1 minute
* Primary terminals indicate power terminals and relay output terminals
** Secondary terminals indicate analog I/O signal, voltage pulse output, and contact input terminals

Note: The withstanding voltage is specified as 2300 V AC per minute to provide a margin of safety.

- Insulation resistance: 20 MΩ or more at 500 V DC between power terminals and grounding terminal
- Grounding: Class 3 grounding (grounding resistance of 100 Ω or less)

Signal Isolations

- PV input terminals: Isolated from other input/output terminals. Not isolated from the internal circuit.
- 15 V DC loop power supply terminals: Not isolated from 4-20 mA analog output and voltage pulse control output. Isolated from other input/output terminals and internal circuit.
- 24 V DC loop power supply terminals: Isolated from the 15 V DC loop power supply terminals, 4-20 mA analog output terminals and voltage pulse control output terminals, other I/O terminals and the internal circuitry.
- 4-20 mA analog output terminals (for control output and retransmission): Not isolated between 4-20 mA outputs and from 15 V DC loop power supply and voltage pulse control output. Isolated from other input/output terminals and internal circuit.
- Voltage pulse control output terminals: Not isolated from 4-20 mA outputs and 15 V DC loop power supply. Isolated from other input/output terminals and internal circuit.
- Relay contact control output terminals: Isolated between contact output terminals and from other input/output terminals and internal circuit.
- Contact input terminals: Not isolated between contact input terminals and from communication terminals. Isolated from other input/output terminals and internal circuit.
- Relay contact alarm output terminals: Not isolated between relay contact alarm outputs. Isolated from other input/output terminals and internal circuit.
- RS-485 communication terminals: Not isolated from contact input terminals. Isolated from other input/output terminals and internal circuit.
- Power terminals: Isolated from other input/output terminals and internal circuit.
- Grounding terminals: Isolated from other input/output terminals and internal circuit.

Environmental Conditions

- Normal operating conditions:
  Ambient temperature: 0 to 50°C (40°C or less for side-by-side close installation)
  The operating ambient temperature range is between 0°C and 40°C when the 24 V DC loop power supply of the UT320 is used.
  Temperature change rate: 10°C/h or less
  Ambient humidity: 20 to 90% RH (no condensation allowed)
  Magnetic field: 400 A/m or less
  Continuous vibration at 5 to 14 Hz: Full amplitude of 1.2 mm or less
  Continuous vibration at 14 to 150 Hz: 4.9 m/s² or less
  Short-period vibration: 14.7 m/s², 15 seconds or less
  Shock: 147 m/s² or less, 11 ms
  Installation height: Height above sea level of 2000 m or less
  Warm-up time: 30 minutes or more after power on

- Transportation and storage conditions:
  Temperature: -25 to 70°C
  Temperature change rate: 20°C/h or less
  Humidity: 5 to 95% RH (no condensation allowed)

- Effects of changes in operating conditions
  - Effects from changes in ambient temperature:
    - On voltage or thermocouple input, ±1 μV/°C or ±0.01% of F.S./°C, whichever is larger
    - On RTD input, ±0.05°C/°C (ambient temperature) or less
    - On analog output, ±0.05% of F.S./°C or less
  - Effects from power supply fluctuation (within rated voltage range)
    - On analog input, ±1 μV/10 V or ±0.01% of F.S./10 V, whichever is larger
    - On analog output, ±0.05% of F.S./10 V or less
1.5 Terminal Wiring Diagrams

**NOTE**

Do not use unassigned terminals as relay terminals.

Terminal wiring diagrams are shown on and after the next page.
## UT350 Standard Type (Model UT350-0□ or UT350-3□) or Heating/Cooling Type (Model UT350-2□)

### Control output
- Relay contact output
  - NC 1
  - NO 2
  - COM 3
  - Contact rating: 250 V AC, 1 A
  - 30 V DC, 1 A (resistance load)

- Alarm output
  - Alarm 1 output
  - Alarm 2 output
  - Alarm 3 output
  - Common
  - Relay contact rating: 240 V AC, 1 A
  - 30 V DC, 1 A (resistance load)

### Power supply
- Power supply
  - L 4
  - N 5
  - Contact voltage: 3 V DC (50/60 Hz shared)

### PV input
- * Not configured at factory before shipment
- See "2. Initial Settings," for more information.

### RS-485 communication
- * Wiring can only be carried out for controllers with communication functions.
- Maximum baud rate: 9600 bps

### SDB(+)
- SDA(-) RDB(+)
- RDA(-)

### 24 V DC loop power supply
- * Wiring can only be carried out for controllers with 24 V DC loop power supply.

### TC input
- RDB(+)
- RDA(-)

### mV/V input
- SDB(+)
- SDA(-)

### Retransmission output
- 4-20 mA DC

### Current/voltage pulse output
- 4-20 mA DC
- Voltage pulse (12 V)

### PV retransmission
- * PV retransmission is configured at factory before shipment.
- Load resistance: 600 Ω or less
- If 15 V DC loop power supply is used, retransmission output cannot be used.

### Heater current detection input
- CT2
- CT1
- COM

### External Contact Input
- * Note: Connecting a 250 Ω resistor to the terminals is optional.
  - Model: X010-250-2 (resistor with M3.5 crimp-on terminal lugs)

### Correspondence between parameter OT and control output types
<table>
<thead>
<tr>
<th>OT=0 (factory-set default)</th>
<th>OT=1</th>
<th>OT=2</th>
<th>OT=3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relay output (terminals 1, 2, and 3)</td>
<td>Time proportional control</td>
<td>Voltage pulse output (terminals 9 and 10)</td>
<td>Current output (terminals 9 and 10)</td>
</tr>
</tbody>
</table>

### Correspondence between parameter DIS and external contact input functions

#### When DIS=OFF
- No function
- Common
- Common
- Common
- Common

#### When DIS=1 (factory-set default)
- 2 SP when DI1=ON
- MAN when DI2=OFF
- AUTO when DI2=ON
- No function
- Common
- Common
- Common

#### When DIS=2
- Hides the LOCK parameter when DI1=ON
- Shows the LOCK parameter when DI1=OFF
- When switching input terminals 10A, 10B, 11A, 11B, 12A, 12B
- 2 SP when DI1=OFF
- WHEN DI1=ON, 3 SP when DI2=OFF
- STOP when DI1=OFF
- RUN when DI1=OFF
- Common
- Common

#### When DIS=3
- 2 SP when DI1=ON
- 3 SP when DI2=OFF
- NO when DI1=OFF
- RUN when DI1=OFF
- ANY when DI2=OFF
- Common
- Common

#### Correspondence between parameter OT and external contact input functions

#### When OT=0 (factory-set default)
- 2 SP when DI1=ON
- MAN when DI2=OFF
- AUTO when DI2=ON
- No function
- Common
- Common
- Common

#### When OT=1
- Time proportional control
- Relay output (terminals 1, 2, and 3)

#### When OT=2
- Voltage pulse output (terminals 9 and 10)

#### When OT=3
- Current output (terminals 9 and 10)

#### Contact rating
- Relay contact output (terminals 1, 2, and 3)
- Contact rating: 12 V DC, 10 mA or more
- Transistor contact

### Note
- Before carrying out wiring, turn off the power to the controller and check that cables to be connected are not alive with a tester or the like because there is a possibility of electric shock.

### Installation category (overvoltage category)
- UT (Model UT350-0□ or UT350-3□)
- II (IEC1010-1)

### CAUTION
- This wiring is only possible for a controller with a heater burnout alarm.
- When switching target setpoints 1 to 4:
  - DI1 DI2
  - 2.SP when DI1=ON
  - 1.SP when DI1=OFF
  - STOP when DI2=ON
  - RUN when DI2=OFF

### NOTE
- OT is a setup parameter. You can change the settings of the parameter OT to change the control output type. See "2. Initial Settings," for more information.

### Receiving 4-20 mA Current Signals with the Controller
- * When receiving 4-20 mA DC current signals, set the PV input type to 1-5 V DC (setpoint "41")

### When switching target setpoints 1 to 4:
- DI1 DI2
- 2.SP when DI1=ON
- 1.SP when DI1=OFF
- STOP when DI2=ON
- RUN when DI2=OFF

### Allowable range
- Power supply: 100 to 240 V AC (10% free voltage) 50/60 Hz shared

### Power supply
- Allowable range: 100 to 240 V AC (10%)
- 50/60 Hz shared

### Alarm output
- Alarm 1 output
- Alarm 2 output
- Alarm 3 output
- Common

### Control output
- Note: Select this option from the OT parameter.

### Relay contact output
- Time proportional PID relay contact output is configured at factory before shipment.

### Relay output (terminals 1, 2, and 3)
- Contact rating: 240 V AC, 1 A
- 30 V DC, 1 A (resistance load)
UT350 Heating/Cooling Type (Model UT350-2)

Heating-side control output

- Relay contact output: 1. Time proportional PID relay contact output is configured at factory before shipment. * Available if 4, 7 or 10 is set in the OT (Control Output Type) setup parameter.
- Relay contact output: 2. R-485 communication.

Alarm output/cooling-side control output

- Alarm 1 output: +5V
- Alarm 2 output: +5V
- Alarm 3 output: +5V

Power supply: 8-10

Heater current detection input: 1. +5V

CAUTION: Connecting a 250 ohm resistor to the terminals is optional. Model: X010-250-2 (resistor with M3.5 crimp-on terminal lugs)

NOTE: External Contact Input

OT is a setup parameter. You can change the settings of the parameter OT to change the control output type. See “2. Initial Settings” for more information.

Correspondence between parameter OT and heating-side/cooling-side output types

OT: 4 (factory-set default) Heating side: Relay output (terminals 1 and 10)
Cooling side: Relay output (terminals 1 and 10)

OT: 5 Heating side: Voltage pulse output (terminals 1 and 10)
Cooling side: Voltage pulse output (terminals 1 and 10)

OT: 6 Heating side: Current output (terminals 1 and 10)
Cooling side: Current output (terminals 1 and 10)

OT: 7 Heating side: Voltage pulse output (terminals 1 and 10)
Cooling side: Voltage pulse output (terminals 1 and 10)

OT: 8 Heating side: Current output (terminals 1 and 10)
Cooling side: Current output (terminals 1 and 10)

OT: 9 Heating side: Voltage pulse output (terminals 1 and 10)
Cooling side: Voltage pulse output (terminals 1 and 10)

OT: 10 Heating side: Current output (terminals 1 and 10)
Cooling side: Current output (terminals 1 and 10)

OT: 11 Heating side: Voltage pulse output (terminals 1 and 10)
Cooling side: Voltage pulse output (terminals 1 and 10)

OT: 12 Heating side: Current output (terminals 1 and 10)
Cooling side: Current output (terminals 1 and 10)

The control output types "relay output" and "voltage pulse output" shown in the table above refer to those of time proportional control.

To change the type to a relay output for on-off control, select “Relay Terminals” and change the setpoint of the proportional band to "0."
**UT320 Standard Type (Model UT320-0\[\text{□}\] or UT320-3\[\text{□}\]) or Heating/Cooling Type (Model UT320-2\[\text{□}\])**

- **Relay contact output**
  - NC
  - NO
  - COM
  - Contact rating: 240 V AC, 1 A or 30 V DC, 1 A (resistance load)

- **Control output**
  - Time proportional PID relay contact output can only be carried out for controllers with communication functions. Maximum baud rate: 9600 bps
  - Note: Select this option from the OT parameter.

- **Alarm output**
  - AL1
  - AL2
  - AL3
  - COM
  - Relay contact rating: 240 V AC, 1 A or 30 V DC, 1 A (resistance load)

- **Power supply**
  - Before carrying out wiring, turn off the power to the controller and check that cables to be connected are not alive with a tester or the like because there is a possibility of electric shock.

- **Alarm input**
  - NC
  - NO
  - COM

- **Current/voltage pulse output**
  - 4-20 mA DC, voltage pulse (12 V)

- **Retransmission output**
  - 4-20 mA DC

- **Retransmission power supply**
  - 15 V DC loop power supply

- **Heater current detection input**
  - Contact rating: 12 V DC, 10 mA or more

- **Correspondence between parameter DIS and external contact input functions**
  - DIS is a setup parameter. Changing DIS setpoint allows you to change the function of external contact input.

- **Note:**
  - External Contact Input: If the power is turned on when the external contact input is OFF, the mode (SP no or A/M) existing before the power is turned off will be continued. (except for RUN/STOP)

---

**Correspondence between parameter OT and control output types**

### CAUTION

- Before carrying out wiring, turn off the power to the controller and check that cables to be connected are not alive with a tester or the like because there is a possibility of electric shock.

### Note

- Connecting a 250 Ω resistor to the terminals is optional. Model: X010-250-2 (resistor with M3.5 crimp-on terminal lugs)

### Notes to 15 V DC loop power supply

- When receiving 4-20 mA DC current signals, set the PV input type to 1-5 V DC (setpoint voltage pulse output).
This chapter describes examples of setting PV input types, control output types, and alarm types. Carrying out settings described herein allows you to perform basic control. Refer to examples of various settings to understand how to set parameters required. Refer to “5.1 Parameter Map” for an easy to understand explanation of setting various parameters. If you cannot remember how to carry out an operation during setting, press the [SET/ENT] key for more than 3 seconds. This brings you to the display (operating display) that appears at power-on.

**Setup Procedure**

1. **Power-on**
   - Denotes a step that must always be followed.

2. **Set PV input.** (Factory-set to “Unspecified.”)
   - Denotes a step that should be followed as necessary.
   - See “2.2 Setting PV Input Type (Setting First at Power-on),” or “2.3 Changing PV Input Type.”

3. **Set the control output.** (Factory-set to “Time Proportional Relay Output.”)
   - See “2.4 Setting Control Output Type.”

4. **Set the alarm type and other setup parameters.**

5. **Set operating parameters.**

6. **Controller operation**

The following explanation of operation for the UT350’s panel, shown in the figure, is the same as that of the UT320’s panel.
2.1 Names and Functions of Front Panel Parts

<table>
<thead>
<tr>
<th>Name of Part</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Process variable (PV) display</td>
<td>Displays PV. Displays a parameter symbol when you set a parameter. Displays an error code (in red) if an error occurs.</td>
</tr>
<tr>
<td>2. Setpoint display</td>
<td>Displays the setpoint (SP) or the output value (OUT) during operation. Displays the set value of parameters on the parameter setting display.</td>
</tr>
<tr>
<td>3. Target setpoint (SP) number indicator lamps</td>
<td>When the SP number currently used for operation is 2, 3 or 4, the respective SP No. indicator lamp lights. When the SP number is 1, the lamp does not light.</td>

IM 05D01D02-41E  2nd Edition : Sep 20,2002-00
2.2 Setting PV Input Type (Setting First at Power-on)

**NOTE**

- The controller displays the operating display when the power is turned on. However, if PV input type has not been set, “IN” appears. In this case, first use the \( \text{[A]} \) key to display the input range code to use, then press the \( \text{[B]} \) key to register it. Then, set the maximum value (RH) and minimum value (RL) of the PV input range (for voltage input, set the maximum value (SH) and minimum value (SL) of the PV input scale).

- The controller is configured to the initial value of each parameter at the factory before shipment. First check the initial values shown in “5.2 Lists of Parameters,” and change parameter values as necessary.

![Example of Temperature Input](image)

![Example of Voltage Input](image)

The following operating procedure describes an example of setting the controller to a K-type thermocouple (-199.9°C to 500.0°C) and the measurement range of 0.0°C to 200.0°C.

1. **Display screen at power-on**

   The parameter “IN” for setting the PV input type appears.

2. **Press the \( \text{[A]} \) or \( \text{[B]} \) key to display the required setpoint.**

   The figure below is an example of the controller set to a K-type thermocouple (-199.9°C to 500.0°C). See “Instrument Input Range Codes.”
3. Press the \[\text{SET/ENT}\] key once to register the required setpoint.

4. Press the \[\text{SET/ENT}\] key once to display the parameter “UNIT” (PV Input Unit).

5. Press the \[\text{SET/ENT}\] key once to display the parameter “RH” (maximum value of PV input range).

6. Press the \[\text{↑} \text{ or } \text{↓}\] key to display the required setpoint. The figure below shows an example of setting the maximum value of PV input range to 200.0°C.

7. Press the \[\text{SET/ENT}\] key once to register the setpoint.

8. Press the \[\text{SET/ENT}\] key once to display the parameter “RL” (minimum value of PV input range).

9. Press the \[\text{↑} \text{ or } \text{↓}\] key to display the required setpoint. The figure below shows an example of setting the minimum value of PV input range to 0.0°C.

10. Press the \[\text{SET/ENT}\] key once to register the setpoint.

11. To set the type of control output, see steps 7 and later in “2.4 Setting Control Output Type.” To finish settings, press the \[\text{SET/ENT}\] key for more than 3 seconds. This returns you to the display shown at power-on (figure below).

The PV display in the figure above shows the error code for input burnout (\textit{bowl}) if PV input wiring is not yet complete. The error code disappears when you wire the PV input terminals correctly.
### Instrument Input Range Codes

Select the unit from the UNIT parameter.

**Performance in the standard operating condition (at 23 ± 2°C, 55 ± 10%RH, and 50/60Hz power frequency)**

**Note 1:** The accuracy is ±0.3°C of instrument range ±1 digit for a temperature range from 0°C to 100°C.

**Note 2:** The accuracy is ±0.5°C of instrument range ±1 digit for a temperature range from -100°C to 200°C.

* To receive a 4-20 mA DC signal, select a standard signal of 1 to 5 V DC and connect it to a 250 Ω resistor. This resistor is optional.

Model: X010-250-2 (resistor with M3.5 crimp-on terminal lugs)

---

**NOTE**

The controller may automatically initialize the registered operating parameter setpoints if any change is made to the data item PV Input Type (IN), Maximum Value of PV Input Range (RH), Minimum Value of PV Input Range (RL), PV Input Decimal Point Position (SDP), Maximum Value of PV Input Scale (SH) or Minimum Value of PV Input Scale (SL). After a change has been made to any of these data items, be sure to verify the registered operating parameter setpoints to ensure that they are correct. If any data item has been changed to its default, set it to a required value.
2.3 Changing PV Input Type

The following operating procedure describes an example of changing the K-type thermocouple (-199.9°C to 500.0°C) to a Pt100 resistance temperature detector (-199.9°C to 500.0°C) and setting the measurement range of 0.0°C to 200.0°C.

1. Bring the operating display into view (display appears at power on).

2. Press the key for more than 3 seconds to call up the menu “OP.PA”.

3. Press the key once to display the menu “STUP”.

4. Press the key once to display the parameter “PWD”.

5. Press the key once to display the menu “FUNC”.

6. Press the key once to display the menu “I/O”.

7. Press the key once to display the parameter “IN” (PV input type).

8. Press the or key to display the required setpoint. The figure below is an example of the controller set to a Pt 100 resistance temperature detector (-199.9°C to 500.0°C).
9. Press the key once to register the setpoint.

10. Press the key once to display the parameter “UNIT” (PV input unit).

11. Press the key once to display the parameter “RH” (maximum value of PV input range).

12. Press the or key to display the required setpoint. The figure below shows an example of setting the maximum value of PV input range to 200.0°C.

13. Press the key once to register the setpoint.

14. Press the key once to display the parameter “RL” (minimum value of PV input range).

15. Press the or key to display the required setpoint. The figure below shows an example of setting the minimum value of PV input range to 0.0°C.

16. Press the key once to register the setpoint.

17. Press the key for more than 3 seconds. This returns you to the display shown at power-on (figure below).

The PV display in the figure above shows the error code for input burnout (bouU) if PV input wiring is not yet complete. The error code disappears when you wire the PV input terminals correctly.
2.4 Setting Control Output Type

The following operating procedure describes an example of changing time proportional PID relay output (0: factory-set default) to current output (2).

<table>
<thead>
<tr>
<th>Control output terminal</th>
<th>Values in parentheses are setpoints</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time proportional PID relay (0)/on-off(3) output</td>
<td>................................. (1)/(2)/(3)</td>
</tr>
<tr>
<td>Current (2)/time proportional PID voltage pulse (1) output</td>
<td>......... (3)/(3)</td>
</tr>
</tbody>
</table>

For details on the heating/cooling control output terminals, see “1.5 Terminal Wiring Diagrams.”

1. Bring the operating display into view (display appears at power on).

2. Press the set/ent key for more than 3 seconds to call up the menu “OP.PA”.

3. Press the key once to display the menu “STUP”.

4. Press the key once to display the parameter “PWD”.

5. Press the key once to display the menu “FUNC”.

6. Press the key once to display the menu “I/O”.

7. Press the key several times to display the parameter “OT” (control output type).

8. Press the or key to display the required setpoint. The figure below shows an example of setting to current output (4 to 20 mA DC).
9. Press the **SET/ENT** key once to register the setpoint.

   ![Display showing PV and setpoint]

10. Press the **SET/ENT** key for more than 3 seconds. This returns you to the display shown at power-on (figure below).

   ![Display returning to power-on display]

### 2.5 Changing Alarm Type

The following operating procedure describes an example of changing alarm-1 (factory-set default: PV high limit alarm) to PV low limit alarm. When you have changed alarm type, the alarm setpoint will be initialized; set the alarm setpoint again.

<table>
<thead>
<tr>
<th>Alarm output terminals</th>
<th>Factory-set defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm-1 (terminal numbers ①-②)</td>
<td>PV high limit alarm</td>
</tr>
<tr>
<td>Alarm-2 (terminal numbers ③-④)</td>
<td>PV low limit alarm</td>
</tr>
<tr>
<td>Alarm-3 (terminal numbers ⑤-⑥)</td>
<td>PV high limit alarm</td>
</tr>
</tbody>
</table>

1. Bring the operating display into view (appears at power-on).

   ![Display showing PV and setpoint]

2. Press the **SET/ENT** key for more than 3 seconds to call up the menu “OP.PA”.

   ![Display showing menu “OP.PA”]

3. Press the **SET/ENT** key once to display the menu “STUP”.

   ![Display showing menu “STUP”]

4. Press the **SET/ENT** key once to display the parameter “PWD”.

   ![Display showing menu “PWD”]
5. Press the SET/ENT key once to display the menu “FUNC”.

6. Press the SET/ENT key several times to display the parameter “AL1” (alarm-1 type).

7. Press the or key to display the required setpoint. The figure below shows an example of setting PV low limit alarm.

8. Press the SET/ENT key once to register the setpoint. You can take the same steps for alarm-2 type (AL2), and alarm-3 type (AL3) that are displayed after this.

9. Press the key for more than 3 seconds. This returns you to the display shown at power-on (figure below).

10. When setting an alarm setpoint, see “3.4 Setting Alarm Setpoints.”
## List of Alarm Types

The table below shows the alarm types and alarm actions.

In the table, codes 1 to 10 are not provided with stand-by actions, while codes 11 to 20 are provided with stand-by actions.

<table>
<thead>
<tr>
<th>Alarm type</th>

Note 1: The fault diagnosis output turns on in case of input burnout, A/D converter failure, or reference junction compensation (RJC) failure.

The control output in case of input burnout or A/D converter failure is set to the value of the PO (Preset Output Value) setup parameter. In case of RJC failure, the controller continues control under the condition of “RJC = OFF”.

Note 2: The FAIL output is on during normal operation and turns off in case of failure.
2.6 Description of Multiple Setpoints and PID

The UT350/UT320 controllers have a maximum of four target setpoint (SP) parameters and has PID for each of these setpoints. The following shows the correspondence between the target setpoint numbers (SP.NO), target setpoints (SP), and PID parameters.

For example, if you have set “2” to the target setpoint number (SP.NO), the control parameters available are target setpoint (2.SP), proportional band (heating-side proportional band) (2.P), integral time (heating-side integral time) (2.I), derivative time (heating-side derivative time) (2.D), cooling-side proportional band (2.Pc), cooling-side integral time (2.Ic), and cooling-side derivative time (2.Dc).

To use multiple target setpoints, see the table below to check the corresponding parameters.

<table>
<thead>
<tr>
<th>Target setpoint number (SP.NO)</th>
<th>Target setpoint (SP)</th>
<th>Proportional band (heating-side proportional band)</th>
<th>Integral time (heating-side integral time)</th>
<th>Derivative time (heating-side derivative time)</th>
<th>Cooling-side proportional band</th>
<th>Cooling-side integral time</th>
<th>Cooling-side derivative time</th>
</tr>
</thead>
<tbody>
<tr>
<td>SP.NO=1</td>
<td>1.SP</td>
<td>1.P</td>
<td>1.I</td>
<td>1.D</td>
<td>1.Pc</td>
<td>1.Ic</td>
<td>1.Dc</td>
</tr>
</tbody>
</table>
3. Operations

This chapter describes key entries for operating the controller. For operations using external contact inputs, see “1.5 Terminal Wiring Diagrams.” If you cannot remember how to carry out an operation during setting, press the SET/ENT key for more than 3 seconds. This brings you to the display (operating display) that appears at power-on.

NOTE

Do not use the instrument generating strong magnetic field such as radio equipment and the like near the controller. This may cause the fluctuation of the PV value.

3.1 Monitoring-purpose Operating Displays Available during Operation

The monitoring-purpose operating displays available during operation are roughly classified into two groups depending on the types of controller. One group is operating displays for a standard controller and the other group is operating displays for a heating/cooling controller.

- Operating Displays for a Standard Controller

  - SP Display
    The PV input value appears on the PV display.
    The target setpoint (1.SP) appears on the Setpoint display.

  - OUT Display
    The PV input value appears on the PV display.
    The control output value (OUT) appears on the Setpoint display.
■ Operating Displays for a Heating/Cooling Controller

• **SP Display**
  The PV input value appears on the PV display.
  The target setpoint (1.SP) appears on the Setpoint display.

• **Heating/Cooling OUT Display**
  The PV input value appears on the PV display.
  The heating (H) and cooling (C) sides control output values appears on the Setpoint display.
3.2 Setting Target Setpoint (SP)

The following operating procedure describes an example of setting 120.0 to a target setpoint. In automatic operation, the controller starts control using set target setpoints.

**NOTE**

When the target setpoint is set through communication, the target setpoint cannot be changed by keystroke.

1. Bring the operating display into view (display appears at power on).

2. Press the \( \uparrow \) or \( \downarrow \) key to display the required setpoint.

3. Press the \( \Rightarrow \) key once to register the setpoint.
3.3 Performing/Canceling Auto-tuning

Auto-tuning should be carried out after setting a target setpoint (SP). Make sure the controller is in automatic operation mode (AUTO) and running state (RUN) before carrying out auto-tuning. See “3.8 Switching between AUTO and MAN,” to change to AUTO and “3.7 Switching between Run and Stop,” to change to Run.

**NOTE**

When on-off control is being used, auto-tuning cannot be carried out. Moreover, do not perform auto-tuning when controlling any of the following processes.

- Control processes with quick response such as flow control or pressure control
- Processes where even temporary output on/off results in inconvenience
- Processes where a large output change at control element results in inconvenience
- Processes where variations in PV may exceed an allowable range, adversely affecting product quality

1. Bring the operating display into view (display appears at power on).

2. Press the **SET/ENT** key for more than 3 seconds to call up the menu “OP.PA”.

3. Press the **SET/ENT** key five times to display the parameter “AT”.

4. Press the **or** **key to display the required setpoint. Tuning for 1.SP is AT = 1.

To cancel auto-tuning, set AT = OFF.
5. Press the SET/ENT key once to register the setpoint. (This starts auto-tuning.) If the SET/ENT key is pressed when AT = OFF, auto-tuning will be cancelled. In this case, PID contains the value existing before auto-tuning.

6. During auto-tuning, the panel indications become as shown below.

Auto-tuning is complete when the MAN lamp goes off.

3.4 Setting PID Manually

If you know the values to be set or if suitable PID constants cannot be obtained by auto-tuning, follow the procedure below to set values.

1. Bring the operating display into view (display appears at power on).

2. Press the key for more than 3 seconds to call up the menu “OP.PA”.

3. Press the key several times to display the parameter “PID”.

4. Press the key once to display “1Gr”.

5. Press the key once to register the setpoints.

6. Press the key once to display the parameter “1.P” (proportional band for 1.SP).
3.5 Setting Alarm Setpoints

The following operating procedure describes an example of setting 160.0 to alarm-1 setpoint. Check alarm type before setting the alarm setpoint. To change the type of alarm, see "2.5 Changing Alarm Type."

<table>
<thead>
<tr>
<th>Alarm output terminals</th>
<th>Factory-set defaults</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm-1 (terminal numbers 5-7)</td>
<td>PV high limit alarm</td>
</tr>
<tr>
<td>Alarm-2 (terminal numbers 3-3)</td>
<td>PV low limit alarm</td>
</tr>
<tr>
<td>Alarm-3 (terminal numbers 2-2)</td>
<td>PV high limit alarm</td>
</tr>
</tbody>
</table>

1. Bring the operating display into view (display appears at power on).

2. Press the key for more than 3 seconds to call up the menu “OP.PA”.

[TIP] The PID parameter numbers set in step 4. should be set as follows:

- In case of PID for 1.SP, PID = 1Gr
- In case of PID for 2.SP, PID = 2Gr
- In case of PID for 3.SP, PID = 3Gr
- In case of PID for 4.SP, PID = 4Gr
3. Press the \text{SET/ENT} key twice to display the parameter “A1”.

   \begin{figure}[h]
   \centering
   \includegraphics[width=0.4\textwidth]{figure1.png}
   \caption{Display parameter “A1”.
   \end{figure}

4. Press the \text{△} or \text{▼} key to display the required setpoint.

   \begin{figure}[h]
   \centering
   \includegraphics[width=0.4\textwidth]{figure2.png}
   \caption{Blinks during change.
   \end{figure}

5. Press the \text{SET/ENT} key once to register the setpoint.

   \begin{figure}[h]
   \centering
   \includegraphics[width=0.4\textwidth]{figure3.png}
   \caption{Also configure the Alarm-2 Setpoint (A2) and Alarm-3 Setpoint (A3) parameters that follow this step.
   \end{figure}

6. Press the \text{SET/ENT} key for more than 3 seconds. This returns you to the display shown at power-on (figure below).

   \begin{figure}[h]
   \centering
   \includegraphics[width=0.4\textwidth]{figure4.png}
   \caption{Displays PV. Displays target setpoint.
   \end{figure}

### 3.6 Selecting Target Setpoint Numbers (SP.NO)

The following operating procedure describes an example of changing a target setpoint number (SP.NO) from 1 to 2.

\begin{warning}

\textbf{NOTE}

If a target setpoint number has been switched using contact input, when the contact input is on, that number cannot be selected by keystroke.

When using target setpoint ramp setting function, PV tracking works if the target setpoint number is switched.

\end{warning}

1. Bring the operating display into view (display appears at power on).

   \begin{figure}[h]
   \centering
   \includegraphics[width=0.4\textwidth]{figure5.png}
   \caption{Displays PV. Displays target setpoint.
   \end{figure}

2. Press the \text{SET/ENT} key for more than 3 seconds to call up the menu “OP.PA”.

   \begin{figure}[h]
   \centering
   \includegraphics[width=0.4\textwidth]{figure6.png}
   \caption{Displays menu “OP.PA”.
   \end{figure}
3. Press the \( \text{SET/ENT} \) key several times to display the parameter “SP.NO”.

4. Press the \( \uparrow \) or \( \downarrow \) key to display the required setpoint.

5. Press the \( \text{SET/ENT} \) key once to register the setpoint.

6. Press the \( \text{SET/ENT} \) key for more than 3 seconds. This returns you to the display shown at power-on (figure below).

3.7 Switching between Run and Stop

Switching between the RUN and STOP states can be performed only using external contact input.

**NOTE**

When the controller is shipped from the factory, it is configured so that switching between the RUN and STOP states cannot be performed. To make the switching possible, configure the DIS setup parameter as “DIS = 4”.

When the controller is stopped, input and outputs are as follows:

<table>
<thead>
<tr>
<th>PV input</th>
<th>Displays PV.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control output</td>
<td>Preset output value (factory-set default: 0%)</td>
</tr>
<tr>
<td>Alarm output</td>
<td>ON in the event of an alarm</td>
</tr>
</tbody>
</table>

When the controller is stopped, control output display is “STOP”.
3.8 Switching between AUTO and MAN

⚠️ NOTE

If AUTO and MAN have been switched using contact input, when the contact input is ON, switching between AUTO and MAN cannot be achieved by keystroke.

1. Bring the operating display into view (display appears at power on).

   ![Display Diagram]

   Displays PV.

   Displays target setpoint.

2. Each time you press the A/M key on the front panel of the instrument, AUTO and MAN is switched alternately.

   ![Switching Diagram]

   In automatic operation

   Displays target setpoint.

   MAN lamp OFF.

   In manual operation

   Displays output-value symbol "o".

   Displays output value.

   MAN lamp ON.
3.9 Manipulating Control Output in Manual Operation

**NOTE**

Control output cannot be changed if the controller is stopped. In this case, the preset output value (setup parameter PO) will be output.

A control output value is linked with a display value changed using the \( \downarrow \) or \( \uparrow \) key. Note that the control output changes as displayed without requiring the SET/ENT key.

1. Bring manual operating display into view. For switching to manual operation, see “3.8 Switching between AUTO and MAN.”

2. Press the \( \downarrow \) or \( \uparrow \) key to change a control output value. You don’t need to press the SET/ENT key.

### Manipulating the Control Output during Heating/Cooling Control

Either of the following two displays appears when the mode is switched to MAN during heating/cooling control.

- **Heating-side OUT display**

  Symbol “\( H \)” represents the heating-side output.

- **Cooling-side OUT display**

  Symbol “\( C \)” represents the cooling-side output.
Controller Behavior and Control Output Manipulation when the Dead Band is Positive

The following is an example when the DB parameter is set at 12.4%.

If you hold down the △ key with the heating-side output under manipulation (i.e., cooling-side output C = 0.0%), the heating-side output (H) decreases. Consequently, both the heating-side and cooling-side outputs change to 0.0%. If you keep the △ key held down longer, you enter the state of manipulating the cooling-side output, and its value begins to increase.

Inversely, if you hold down the □ key with the cooling-side output under manipulation (i.e., heating-side output H = 0.0%), the cooling-side output (C) decreases. Consequently, both the heating-side and cooling-side outputs go to 0.0%. If you keep the □ key held down longer, you enter the state of manipulating the heating-side output, and its value begins to increase.
4. **Troubleshooting and Maintenance**

4.1 **Troubleshooting**

**Troubleshooting Flow**

If the operating display does not appear after turning on the controller’s power, follow the measures in the procedure below.

If a problem appears complicated, contact our sales representative.

- If key lock operation is faulty?
  - Yes: Check the key lock setting.
  - No: Turn off power, and then turn it on again.

- Is display faulty?
  - Yes: Check the specifications of the instrument's I/O counterpart.
  - No: Check the key lock setting.

- Is I/O signal faulty?
  - Yes: Check the specifications of I/O counterpart for wrong polarity.
  - No: Check the communication-related parameters.

- Is communication link faulty?
  - Yes: Check the communication wiring.
  - No: Check the specifications of communication counterpart.

- Totally inoperable?
  - Yes: Check wiring on the power supply terminals.
  - No: Check the supply voltage.

- Normal?
  - Yes: Incorrect? Correct? (Correct events)
  - No: Ask the vendor for repair (Find the cause)

- Is the instrument defective?
  - Yes: No communication capability.
  - No: Check the code include a communication option?

**IMPORTANT**

Take note of the parameter settings when asking the vendor for repair.
### Errors at Power on

The following table shows errors that may be detected by the fault diagnosis function when the power is turned on.

<table>
<thead>
<tr>
<th>Error indication (on PV display unit)</th>
<th>Description of error</th>
<th>PV</th>

</tr>
</tbody>
</table>

### If a Power Failure Occurs during Operation

- **Momentary Power Failures shorter than 20 ms**

  The controller is not affected at all and continues normal operation.
● Power Failures of 20 ms or longer

- The alarm function of the controller continues to work normally. (Alarms with the stand-by feature temporarily return to their stand-by state, however.)
- Setting parameters that have already been configured retain their settings.
- Auto-tuning is cancelled.
- After recovery from a power failure, control action resumes in the same mode as the one before the occurrence of the power failure. The control output begins with the preset output value.

Troubleshooting when the Controller Fails to Operate Correctly

If your control tasks are not successful, check the preset parameters and controller wiring before concluding the controller to be defective. The following show some examples of troubleshooting you should refer to in order to avoid the possibility of other problems.

● The Controller does not Show the measured input (PV).

- The UT350/UT320 controllers have a universal input.
  The type of PV input can be set/changed using the parameter "IN". At this point, the controller must be wired correctly according to the selected type of PV input. Check the wiring first if the controller fails to show the correct PV. To do this, refer to “2. Initial Settings.”
  With the parameters “RH”, “RL”, “SDP”, “SH” and “SL”, it is possible to scale the input signal and change its number of decimal places. Also check that these parameters are configured correctly.

● The Controller does not Provide any Control Output or the Control Output does not Change at all.

- The UT350/UT320 controllers have a universal output.
  The type of control output can be set/changed using the parameter “OT”.
  At this point, the controller must be wired correctly according to the selected type of control output. Check the wiring first if the controller provides no control output. To do this, refer to “1.5 Terminal Wiring Diagrams.”
  With the parameters “OH” and “OL”, it is possible to set/change the high and low limits of control output. The control output may not change at all, however, because of restrictions on these parameters. Also check the restrictions on these parameters.
  - The control output can only be changed when the controller is in the MAN mode. If the MAN lamp is off (i.e., the controller is in the AUTO mode), you cannot change the control output using key operation.

● The control output does not change soon after the target setpoint (SP) has been changed.

- If this happens, check the setpoint of the parameter “C.MD”. In cases where fixed-point control is selected as the PID control mode (C.MD = 1), tracking based on the I-term works to prevent the control output from changing suddenly even if the target setpoint SP is varied.
  The control output therefore may appear to be working incorrectly at first; however it gradually adapts itself to the new target setpoint.
4.2 Maintenance

This section describes the cleaning and maintenance of the UT350/UT320.

4.2.1 Cleaning

The front panel and operation keys should be gently wiped with a dry cloth.

NOTE

Do not use alcohol, benzine, or any other solvents.

4.2.2 Replacing Brackets

When the brackets are broken or lost, purchase the following brackets for replacement.

<table>
<thead>
<tr>
<th>Target Model</th>
<th>Part No.</th>
<th>Sales Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>UT350</td>
<td>T9115NL</td>
<td>A large bracket and small bracket in pair</td>
</tr>
<tr>
<td>UT320</td>
<td>T9115NK</td>
<td>Two small brackets in pair</td>
</tr>
</tbody>
</table>

SEE ALSO

“1.2 How to Install,” for how to replace brackets.

4.2.3 Attaching Terminal Cover

When a terminal cover is necessary, purchase the following part.

<table>
<thead>
<tr>
<th>Target Model</th>
<th>Part No.</th>
<th>Sales Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>UT350</td>
<td>T9115YD</td>
<td>1</td>
</tr>
<tr>
<td>UT320</td>
<td>T9115YE</td>
<td>1</td>
</tr>
</tbody>
</table>
Attaching Terminal Cover

The procedure for attaching the terminal cover is as follows.

**CAUTION**

Do not touch the terminals on the rear panel when power is being supplied to the controller. Doing so may result in electric shock.

Before attaching the terminal cover, turn off the source circuit breaker and use a tester to check that the power cable is not conducting any electricity.

1. Before attaching the terminal cover, fold it once or twice so that the side which has the “Handle With Care” symbol (⚠️), is on the outside.

   ![Folding Direction of Terminal Cover](image)

   Folding Direction of Terminal Cover

**NOTE**

Do not fold the terminal cover the wrong way, doing so not only reduces the cover’s strength but may also cause the hinge to crack, thereby disabling attachment.

2. With the cover properly folded, fit its top and bottom holes to the protrusions of the mounting brackets.

   ![Attaching Terminal Cover](image)

   Attaching Terminal Cover
4.2.4 Replacing Parts with a Limited Service Life

The following UT350/UT320 parts have a limited service life. The service life given in the table assume that the controller is used under normal operating conditions.

<table>
<thead>
<tr>
<th>Part</th>
<th>Service life</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aluminum electrolytic condenser</td>
<td>About 10 years (rated)</td>
</tr>
<tr>
<td>EEPROM</td>
<td>About 100,000 times of writings</td>
</tr>
<tr>
<td>Alarm output relays</td>
<td>About 100,000 more ON-OFF operations or with resistance load</td>
</tr>
<tr>
<td>Control output relays</td>
<td>About 100,000 more ON-OFF operations or with resistance load</td>
</tr>
</tbody>
</table>

If any of these parts, except control output relays, cause a controller failure due to deterioration, contact your dealer for replacement at your cost. Control output relays can be replaced by yourself.

SEE ALSO

“4.2.5 Replacing Control Output Relays,” for how to replace the control output relays.
4.2.5 Replacing Control Output Relays

This subsection describes how to replace the control output relays. The replacement must be performed by an engineer qualified for the work.

**CAUTION**

Always turn off the power before starting the work in order to avoid electric shock. Do not pull out the internal unit for any other purpose other than to replace the control output relays.

1. Insert a flat-blade screwdriver (tip width of 6 mm is recommended) into the opening with the tip in parallel with the front panel, and then turn the screwdriver gently. Take this procedure to four openings 1, 2, 3 and 4 (see the figure below) on the upper and lower parts of the bezel, in order. The bezel slightly moves forward from the housing.

2. Push up the center of the bottom gasket of bezel by a finger to release the latch.
3. Insert the screwdriver into the four openings and flip the tip forward to move the bezel more forward.

4. Hold the bezel and pull it along with the internal unit out of the housing. (Note) Be careful not to damage the RJC sensor.

5. The location and number of the relays differ depending on the model code of the UT350/UT320. Confirm the location of the control output relay to be replaced before pulling out the relay.

6. Pull out the relay to be replaced. The control output relays are easy to remove and mount, since they are connected via a socket onto the print boards.

   Insert the new relay in the socket. Use the following relay.

<table>
<thead>
<tr>
<th>Manufacturer</th>
<th>OMRON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model</td>
<td>G6B-2114P-FD-US-P6B</td>
</tr>
<tr>
<td>Power supply</td>
<td>12 V DC</td>
</tr>
</tbody>
</table>
7. Insert the internal unit into the housing. 
Apply power to the controller and confirm that the initial operating display is shown. 
If the operating display is not shown properly, turn off the controller and pull out the internal unit. Then, insert it into the housing again.

This completes replacement of the control output relay.
5. Parameters

This chapter contains a parameter map as a guideline for setting parameters, and lists of parameters for recording User Settings.

5.1 Parameter Map
UT350/UT320 Parameter Map

Operating Display

SP display → SET → OUT display

Menu

SET3S

SP display

SET/ENT

To switch the parameter display, press the $\triangle$ key.

SET

SP, NO

FL

BS

UPR

DNR

OH

OL

H

DR

HB1

HB2

HC1

HC2

ORB

ORH

ORL

OR

1.SP

2.SP

3.SP

4.SP

FL is displayed if you press the SET/ENT key when PID = MENU.

The setpoints of the ORB, ORH and ORL parameters are only effective when a sensor grounding alarm is used.

The OR parameter represents the moving average (for 5 cycle times) of the control output and is not a setpoint.

NOTE

Changing the registered value of a setup parameter may cause the registered value of an operating parameter to be initialized automatically. Thus, when you have changed a setup parameter, always check that the registered value of the operating parameter is appropriate. If it is initialized to default, reset it to the required value.
When shipped from the factory, this parameter appears first after power-on.

Password check display

- Password input
  - (No password is required when PWD = 0.)

I/O

- Displayed only for controllers with communication functions.
- This parameter is not to be set.

FUNCTION

- Not displayed when OT parameter set to 4 to 6.
- Displayed for heating/cooling control.
- Displayed for heating/cooling control.

Press the \[\text{SET}\] or \[\text{SET3S}\] key once.

Press the \[\text{SET3S}\] key for 3 seconds.

Press the \[\text{SET}\] or \[\text{SET3S}\] key once.
## 5.2 Lists of Parameters

- Parameters relating to PV or setpoints should all be set in real numbers. For example, use temperature values to define target setpoints and alarm setpoints for temperature input.

- The "User Setting" column in the table is provided for the customer to record setpoints.

- The column "Target Item in CD-ROM" in the table provides references from User’s Manual (Reference) (CD-ROM version) which describes items in more detail and items that are not contained in this manual.

- Numbers in ( ) are the parameter setpoints that apply when the communication function is used. ex. OFF (0), ON (1)

### PID-related Parameters

The following parameters are displayed when “1Gr” is set to PID parameter display number (PID).

In this case, the corresponding target setpoint is 1.SP (target setpoint-1).

To set PID corresponding to target setpoint 2 to 4, set “2Gr”, “3Gr”, or “4Gr” to PID. The relevant parameters will then be displayed.

\( RDV \) (RDV) Reference deviation OFF (0), 0.0 to 100.0% of PV input range span Used to select PID constants according to a deviation from the setpoint. The 4th group of PID constants is used when the controller fails to keep track of the deviation. OFF (0) Ref.4.1(1)
Auto-tuning

Auto-tuning is a function with which the controller automatically measures the process characteristics to automatically set the optimum PID constants. This function does not work when the controller is performing on-off control. The UT350/UT320 employ the “Limit Cycle Method.” As shown in the figure below, the controller temporarily changes its control output in a step-waveform manner. Then, it calculates the optimum proportional band (P), integral time (I) and derivative time (D) from the resulting response to set them in their respective parameters.

If the Output High Limit (OH) and Output Low Limit (OL) parameters are already configured, the control output turns on and off only between the output’s high and low limits during auto-tuning.

- **Auto-tuning Using Zone PID (see “■ PID Switching (Zone PID)” later in this chapter)**

<table>
<thead>
<tr>
<th>Setting of AT Parameter</th>
<th>Auto-tuned Setpoint</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>OFF</td>
<td>-</td>
<td>Auto-tuning is turned off (disabled).</td>
</tr>
<tr>
<td>1</td>
<td>The setpoints when auto-tuning is started</td>
<td>Determines the values of 1.P, 1.I and 1.D parameters by auto-tuning.</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>Determines the values of 2.P, 2.I and 2.D parameters by auto-tuning.</td>
</tr>
<tr>
<td>AUTO</td>
<td>Median value of each zone width</td>
<td>Determines the values of all PID parameters in use by auto-tuning.</td>
</tr>
</tbody>
</table>

The AT parameter settings numbered 1 to 4 in the table above are dependent on how many zones have been set. For example, if you have set two zones, you can use AT parameter settings 1 and 2. Likewise, if you have set three zones, you can use AT parameter settings 1, 2 and 3.
Hysteresis (for Target Setpoints (On-Off Control) and Alarm Setpoints)

Hysteresis can be set in on-off control setpoints and alarm setpoints as well. With the hysteresis settings, it is possible to prevent relays from chattering.

- When hysteresis is set in a target setpoint

![Diagram of hysteresis in target setpoint](image)

- When hysteresis is set in an alarm setpoint

![Diagram of hysteresis in alarm setpoint](image)

Target Setpoint Ramp Setting Function

Use this function to prevent the target setpoint from changing suddenly. The ramp setting function works when:

1. the target setpoint is changed (example: change in “1.SP” from 100°C to 150°C);
2. the target setpoint number is switched (example: switch from “1.SP” to “3.SP”);
3. the power is turned on or the controller is recovered from power failure;
4. a change is made from manual operation to automatic operation; or
5. a change is made from the STOP state to the RUN state.

If the target setpoint before switching is smaller than the target setpoint after switching, the controller operates according to the settings of the Setpoint Ramp UP (UPR) and Ramp Time Unit (TMU) parameters. If the target setpoint before switching is greater than the target setpoint after switching, the controller operates according to the settings of the Setpoint Ramp Down (DNR) and Ramp Time Unit (TMU) parameters.

**NOTE**

When using target setpoint ramp setting function, PV tracking works in case of the above conditions [2] to [5].
The figure below shows an example when the Target Setpoint Number (SP.NO) parameter is switched. The 1.SP and 2.SP parameters are set to 500°C and 640°C, respectively. Thus, there is a temperature difference of 140°C between the 1.SP and 2.SP parameters. This example shows how the temperature is changed by as much as this temperature difference over a period of two minutes. In this example, the UPR parameter is 70°C and the TMU parameter is 1 minute.

When using target setpoint ramp setting function, PV tracking works in case of the above conditions [2] to [5].

NOTE
PID Switching (Zone PID)

Using a zone PID, you can automatically switch between groups of PID constants according to the temperature zone. You can set a maximum of three temperature zones.

<Setting Method>

[1] Set the Zone PID Selection (ZON) parameter to “ON”.

When using two zones, define only reference point 1 (1.RP) between the minimum and maximum values of the PV input range.
When using three zones, define reference points 1 and 2 (1.RP and 2.RP) in the same way as noted above.

NOTE
Set the maximum and minimum values, as close as possible to those of the actual range to be controlled, in the Maximum Value of PV Input Range (RH) and Minimum Value of PV Input Range (RL) parameters. Otherwise, the controller may fail to determine the optimum values when auto-tuning is carried out.

</tr>
</tbody>
</table>
Heating/Cooling Control (for a Heating/Cooling Controller Only)

In heating/cooling control, the controller outputs the result of computation after splitting it into heating-purpose and cooling-purpose signals. In addition, the controller can perform PID control or on-off control on the heating and cooling sides separately. When performing on-off control, set the proportional band to “0”.

The controller splits the result of computation (0 to 100%) into heating-side and cooling-side signals, as described below.

- 0% to 50% of the computation result is presented as a 0% to 100% cooling-side output.
- 50% to 100% of the computation result is presented as a 0% to 100% heating-side output.

Heating/cooling control provides two methods in which either none of the heating- and cooling-side outputs are presented or both of the heating- and cooling-side outputs are presented, as shown in the following figures.

Precautions in Heating/Cooling Control

- Keep the ratio of the heating-side proportional band (P) to the cooling-side proportional band (Pc) equal to or below 5.
- If neither the heating side nor the cooling side is performing on-off control, setting the integral time (I or Ic) of one side to “0” results in the Integral Time parameters of both sides being set to “OFF”, irrespective of the integral time setting of the other side.
## Cycle Time

A cycle time can only be set if the type of control output is time proportional PID relay output or time proportional voltage pulse output.

A cycle time refers to one period consisting of on-and off-state time lengths.

The ratio of the on-state time to the off-state time differs according to the value of the control output.

The figure below shows on-to-off time ratios of the control output when the cycle time is set to 10 seconds. Setting a shorter cycle time allows the controller to perform elaborate control at short time intervals. This significantly reduces the on-and off-state times, however it shortens the service life of a relay.

### Relay’s Behavior when Cycle Time = 10 sec.

Functions and Parameters for “Standard Type” in Initial State (Factory-set default)

Functions and parameters in initial state are given in the tables below. For details on each parameter, refer to “5.2 Lists of Parameters.”

■ PV Input

PV input (INPUT) is a universal input, which can receive signals from thermocouple, RTD, or DC voltage signals. The controller is capable of biasing, and first-order lag computation (filtering) on input signals.

Each function can be set by the following parameters.

Setup Parameters

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input selection</td>
<td>IN</td>
<td>I/O</td>
</tr>
<tr>
<td>Unit selection</td>
<td>UNIT</td>
<td>I/O</td>
</tr>
<tr>
<td>Input range conversion</td>
<td>RH, RL (SDP, SH, SL)</td>
<td>I/O</td>
</tr>
</tbody>
</table>

Operating Parameters

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>PV input bias</td>
<td>BS</td>
<td>OP.PA</td>
</tr>
<tr>
<td>PV input filter</td>
<td>FL</td>
<td>OP.PA</td>
</tr>
</tbody>
</table>

■ Remote Input

Remote input can be received via communication. Set “0” in the parameter SP.NO (target setpoint number selection) for remote input. For more information, refer to GREEN Series Communication Functions (IM 05G01B02-01E).

Each function can be set by the following parameters.

Operating Parameters

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target setpoint number selection</td>
<td>SP.NO</td>
<td>OP.PA</td>
</tr>
</tbody>
</table>
Contact Input

Changing the setpoint of the parameter DIS (DI function selection) allows you to change the function of contact input.

- **When DIS=OFF**
  No function for contact input.

- **When DIS=1 (factory-set default)**
  Target setpoint 2 (ON)/Target setpoint 1 (OFF) switching function is assigned to DI1 (contact input 1).
  Automatic (ON)/Manual (OFF) switching function is assigned to DI2 (contact input 2).
  Manipulated output can be changed using the \(\uparrow\) and \(\downarrow\) keys in manual mode.

- **When DIS=2**
  Hide (ON)/Show (OFF) the parameter LOCK (key lock) switching function is assigned to DI1 (contact input 1).
  No function is assigned to DI2 (contact input 2).

- **When DIS=3**
  It is possible to select one out of four setpoints by turning the two contact input signals ON or OFF. This function is assigned to DI1 (contact input 1) and DI2 (contact input 2).

<table>
<thead>
<tr>
<th>Contact input</th>
<th>Target setpoint number to be selected (SP.NO)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1</td>
</tr>
<tr>
<td>DI1</td>
<td>OFF</td>
</tr>
<tr>
<td>DI2</td>
<td>OFF</td>
</tr>
</tbody>
</table>

For example, set contact input 1 (DI1) only to “ON” to change target setpoint 1 to 2. Set contact inputs 1 (DI1) and 2 (DI2) to “ON” to select target setpoint 4.

- **When DIS=4**
  Target setpoint 2 (ON)/Target setpoint 1 (OFF) switching function is assigned to DI1 (contact input 1).
  Run (OFF)/Stop (ON) switching function is assigned to DI2 (contact input 2). Preset output value is output when the operation is stopped. PV input and alarms remain functioning as normal.
Target Setpoint and PID

It is possible to use a maximum of four groups of target setpoints and PID parameters. The target setpoint can be selected by key operation or contact input. For selection by contact input, refer to “Contact Input.”

Operating Parameters

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target setpoint number selection</td>
<td>SP.NO</td>
<td>OP.PA</td>
</tr>
<tr>
<td>Target setpoints 1 to 4</td>
<td>n.SP</td>
<td>OP.PA</td>
</tr>
<tr>
<td>Proportional band (P)</td>
<td>n.P</td>
<td>OP.PA</td>
</tr>
<tr>
<td>Integral time (I)</td>
<td>n.I</td>
<td>OP.PA</td>
</tr>
<tr>
<td>Derivative time (D)</td>
<td>n.D</td>
<td>OP.PA</td>
</tr>
</tbody>
</table>

Note: Parameters n.SP, n.P, n.I, n.D (n=1 to 4) correspond to the target setpoint number selected in the target setpoint number selection (SP.NO).

The target setpoint ramp rate setting function prevents the target setpoint form changing suddenly. It is possible to set the upward and downward changing rate (i.e., ramp rate) independently in the parameters UPR and DNR. The unit of the ramp rate (hour, or minute) is specified in TMU.

Setup Parameters

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ramp-rate time unit setting</td>
<td>TMU</td>
<td>FUNC</td>
</tr>
</tbody>
</table>

Operating Parameters

<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target setpoint ramp-rate setting</td>
<td>UPR, DNR</td>
<td>OP.PA</td>
</tr>
</tbody>
</table>
## Control Output

Control output (OUTPUT1) selects the output type among the current output, voltage pulse output, and relay contact output signal.

Preset output value is output when the operation is stopped by key operation or contact input, which takes priority over the manual operation.

Each function can be set by the following parameters.

### Setup Parameters

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control output type selection</td>

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output limiter</td>
<td>OL, OH</td>
<td>OP.PA</td>
</tr>
</tbody>
</table>

## Contact Output

Alarm 1 is output via DO1 (contact output 1).

Alarm 2 is output via DO2 (contact output 2).

Alarm 3 is output via DO3 (contact output 3).

### Setup Parameters

<table>
<thead>
<tr>

</tr>
<tr>
<td>Alarm 3 setpoint</td>
<td>A3</td>
<td>OP.PA</td>
</tr>
</tbody>
</table>
Retransmission Output

PV, target setpoint, or control output can be output to retransmission output (OUTPUT2/RET).

Each function can be set by the following parameters.

**Setup Parameters**

<table>
<thead>
<tr>
<th>Function</th>
<th>Parameter</th>
<th>Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retransmission output type</td>
<td>RET</td>
<td>I/O</td>
</tr>
<tr>
<td>Retransmission output scale</td>
<td>RTH, RTL</td>
<td>I/O</td>
</tr>
</tbody>
</table>

15 V DC Loop Power Supply

The 15 V DC loop power supply (OUTPUT2/RET) uses the same terminal as retransmission output. The 15 V DC loop power supply cannot be used when retransmission output is used. To use the 15 V DC loop power supply, set “4” in retransmission output type selection parameter RET.

Each function can be set by the following parameters.

**Setup Parameters**

<table>
<thead>
<tr>
<th>Function</th>
