Thank you for purchasing the UT351/UT321 digital indicating controllers.

Models UT351 / UT321 **Digital Indicating Controllers** with Active Color PV Display User's Manual Installation

This manual describes installation, wiring, and other tasks required to make the controller ready for operation.

Contents

The controller is shipped from the factory with 4 hardcopy user's manuals (A2 and A3 size) and 1 user's manual on CD-

ROM. The 4 user's manuals in hardcopy format describe the operating procedures required for basic use. It is recommended

that you refer to these user's manuals to understand [1] installation, [2] initial settings, and [3] operating procedures of the

The CD-ROM contains an User's Manual (Reference) with descriptions of various functions and setting ranges that can be

Moreover, the use of an optional parameter setting tool (model: LL100-E10) allows you to easily perform settings and

3rd Edition: Apr. 1, 2003

# 3. How to Install

NOTE

(7) no wind blows against the terminal board (reference junction compensation element)

(8) no water is splashed,

(9) no flammable materials are around,

Never place the controller directly on flammable items or equipment.

If the controller has to be installed close to flammable items or equipment, be sure to provide shielding panels all around the controller, at least 150mm away from every side; the panels should be made of either 1.43mm-thick metal-plated steel plates or 1.6mm-thick uncoated steel plates.

M NOTE

Never touch the opening at the bottom of the case. It is to be used in the factory at shipping.

#### Installation Position

Install the controller at an angle within 30° from horizontal Front panel with the front panel facing upward. Do not install it facing of controller downward. The position of right and left sides should be horizontal

# 1. Safety Precautions

The following symbol is indicated on the controller to ensure safe use

### CAUTION

This symbol on the controller indicates that the operator must refer to an explanation in the user's manual in order to avoid the risk of injury or death of personnel or damage to the instrument. The manual describes how the operator should exercise special care to avoid electric shock or other dangers that may result in injury or loss of life.

The following symbols are used in the hardcopy user's manuals and in the user's manual supplied on the CD-ROM.

## M NOTE

Indicates that operating the hardware or software in a particular manner may damage it or result in a system failure.

# IMPORTANT

Draws attention to information that is essential for understanding the operation and/or features of the controller.

and suffix codes match your order

### 2. Model and Suffix Codes

Before using the controller, check that the model and suffix codes match your order.						
Model	Suffix	Code	Description			
UT351			Digital indicating controller (provided with retransmission output and 15 V			
UT321			DC loop power supply as standard)			
	-0		Standard type			
Туре	-2		Heating/cooling type			
-3			Standard type (with 24 V DC loop power supply)			
		0	None			
Optional functions		1	With communication, heater burnout alarm			
		2	With heater burnout alarm			

#### Check that the following items are provided

- · Digital indicating controller (of ordered model)
- · Brackets (mounting hardware): . . 1 pair

# CAUTION

ontrolle

Turn off the power to the controller before installing it on the panel because there is a possibility of electric shock

# 4. How to Connect Wires

#### CAUTION

- 1) Before carrying out wiring, turn off the power to the controller and check that the cables to be connected are not alive with a tester or the like because there is a possibility of electric shock. 2) Wiring must be carried out by personnel who have basic electrical knowledge and practical experience.
- NOTE
  - 1) Provide power from a single-phase instrument power supply. If there is a lot of noise in the power line, insert an insulating transformer into the primary side of the line and use a line filter (recommended part: ZAC2205-00U from TDK) on the secondary side.
  - As a countermeasures against noise, do not place the primary and secondary power cables close to each other. 2) For thermocouple input, use shielded compensating lead wires for wiring. For RTD input, use shielded wires that have low conductor resistance and cause no significant differences in resistance between the three wires. The cables to be used for wiring, terminal specifications, and recommended parts are as shown below.
  - 3) Control output relays may be replaced. However, because they have a life of 100,000 times that of the resistance load, use auxiliary relays to turn on/off a load.
  - 4) The use of inductance (L) loads such as auxiliary relays, motors and solenoid valves causes malfunction or relay failure; always insert a CR filter for use with alternating current or a diode for use with direct current, as a spark-removal surge suppression circuit, into the line in parallel with the load.
  - 5) When there is possibility of being struck by external lightening surge, use the arrester to protect the instrument.

#### Cable Specifications and Recommended Cables

Purpose	Name and Manufacturer
r supply, grounding, relay contact outputs	600 V PVC insulated wires, JIS C 3307, 0.9 to 2.0 mm <sup>2</sup>
mocouple	Shielded compensating lead wires, JIS C 1610, X
	Shielded wires (three conductors), UL2482 (Hitachi Cable)
r signals	Shielded wires

rget Model	Part Number	Sales Unit
T351	T9115YD	1
T321	T9115YE	1

1. Before attaching the terminal cover, bend the side with the groove inward as shown in Fig. A. Be careful not to bend it backwards. This not only marks it harder to attach the cover but will also weaken its hold.

2. Fit the holes on the top and bottom of the terminal cover the projections on the brackets (Fig. B) and lock in place. The figure right shows the attachment of a terminal cover to UT controller.

- **PV Input Signals**
- Number of inputs: 1 (terminals (1)-(2)-(3)) Input type: Universal input system. The input type can be selected with the software Sampling period: 250 ms
- Burnout detection: Functions at TC, RTD, standard signal (0.4 to 2 V or 1 to 5 V) Upscale, downscale, and off can be specified. For standard signal, burnout is determined to have occurred
- if it is 0.1 V or less Input bias current: 0.05 µA (for TC or RTD b-terminal)
- Measurement current (RTD): About 0.13 mA Input resistance:  $1 \ M\Omega$  or more for thermocouple or mV input About 1 M $\Omega$  for DC voltage input
- Allowable signal source resistance: 250  $\Omega$  or less for thermocouple or mV input Effects of signal source resistance: 0.1  $\mu V/\Omega$  or less
- $2 \ k\Omega$  or less for DC voltage input Effects of signal source resistance: About 0.01%/100  $\Omega$  Allowable wiring resistance: for RTD input Maximum 150  $\Omega$ /wire: Conductor resistance between three wires should be equal
- However, 10  $\Omega$ /wire for a maximum range of -150.0 to 150.0°C. Wire resistance effect:  $\pm 0.1^{\circ}$ C /10  $\Omega$
- Allowable input voltage:  $\pm 10$  V DC for thermocouple, mV, or RTD input
- ±20 V DC for DC voltage input Noise rejection ratio: 40 dB (50/60 Hz) or more in normal mode
- 120 dB (50/60 Hz) or more in common mode Reference junction compensation error: ±1.0°C (15 to 35°C)
- $\pm 1.5^{\circ}$ C (0 to  $15^{\circ}$ C, 35 to  $50^{\circ}$ C) Applicable standards: JIS, IEC, DIN (ITS-90) for thermocouples and RTD

#### Loop Power Supply

plies power to a two-wir (15 V DC: terminals (4)-(5); 24 V DC: terminals (2)-(2)) A resistor (10 to 250  $\Omega$ ) connected between the controller and transmitter converts a current signal into a voltage signal, which is then read via the PV input terminal. Supply voltage: 14.5 to 18.0 V DC, max. 21 mA (provided with a protection circuit against a field short-circuit); 21.6 to 28.0 V DC, max, 30 mA (only for models with 24 V DC loop power supply)

When using the 24 V DC loop power supply of the UT321, keep the operating ambient temperature between 0°C and  $40^{\circ}C$ 

#### **Retransmission Output**

Either PV, target setpoint, or control output is output. Either the retransmission output or the loop power supply can be used with terminals 4-5.

- Number of outputs: 1 (terminals (4-(5))
- Output signal: 4-20 mA DC
- Load resistance: 600 Ω or less + Output accuracy:  $\pm 0.3\%$  of span under standard operating conditions (23  $\pm$ 2°C, 55  $\pm$ 10% RH, power frequency of 50/60 Hz)

## Control Output

m, The output type can be selected output sys with the software.

Current output (Standard type: terminals 6-7); Heating side: terminals 16-10; Cooling side: terminals (4-15)

Number of outputs	1 or 2 (two for heating/cooling type), switched between a voltage pulse output and current output.
Output signal	4-20 mA DC
Load resistance	600 $\Omega$ or less
Output accuracy	$\pm$ 0.3% of span under standard operating conditions (23 $\pm$ 2 °C, 55 $\pm$ 10% RH, power frequency of 50/60 Hz)

• Voltage pulse output (Standard type: terminals 6-17); Heating side: terminals (6-17); Cooling side: terminals (4-15)

Number of outputs	1 or 2 (two for heating/cooling type), switched between a voltage pulse output and current output.
Output signal	On-voltage = 12 V or more (load resistance: 600 $\Omega$ or more) Off-voltage = 0.1 V DC or less
Resolution	10 ms

• Relay contact output (Standard type: terminals 1)-2)-3; Heating side: terminals (1)-(2)-(3); Cooling side: terminals (4)-(7))

	-
Number of outputs	1 or 2 (two for heating/cooling type)
Output signal	Three terminals (NC, NO, and common) / Two terminals
Contact rating	Terminals ① - ② - ③: 250 V AC or 30 V DC, 3 A (resistance load) Terminals ④-⑦: 240 V AC or 30 V DC, 1A (resistance load)
Resolution	10 ms

#### Contact Inputs

Fold the cover in the direction

Fit the cover hold

over the protrusion

on the mounting bracket

of the arrow

Figure A

Figure B

- · Purpose: Selection between target setpoints or Auto/Man modes, or for other purposes
- Number of inputs: 2 • Input type: Non-voltage contact or transistor open collector input
- Input contact rating: 12 V DC, 10 mA or more
- On/off determination: For non-voltage contact input, contact
- resistance of 1 k $\Omega$  or less is determined as "on" and contact resistance of 20 k $\Omega$  or more as "off." For transistor open collector input, input voltage of 2 V or less is determined as "on" and leakage current must not
- exceed 100 µA when "off." Minimum status detection hold time: About 1 second

#### Contact Outputs

- Purpose: Alarm output, FAIL output, and others
- Number of outputs: 3 • Relay contact rating: 240 V AC/1 A or 30 V DC/1 A ; 1a (COM
- terminal is common), (FAIL output ; 1b)

#### Display Specifications

- UT351: 4-digit, 7-segment green or red LED display,
- character height of 20 mm UT321: 4-digit, 7-segment green or red LED display
- character height of 12 mm · Setpoint display: 4-digit, 7-segment red LED display, character
- height of 9.3 mm (for both UT351 and UT321) Status indicating lamps: LEDs

#### Safety and EMC Standards

- Safety: Compliant with IEC1010-1: 1990 and EN61010-1: 1993+A2:1995
  - Approved by CSA1010 CSA1010 installation category (overvoltage category)
- CATII (IEC1010-1) Approved by UL508
- (UT321:Application for certification made)
- EMC standards: Complies with EN61326. The instrument continues to operate at a measuring
- accuracy of within ±20% of the range during tests. (UT321:To be obtained)

#### Construction, Installation, and Wiring

- · Construction: Only the front panel is dust-proof and drip-proof (protection class IP55) For side-by-side close installation the controller loses its
- dust-proof and drip-proof protection · Material: ABS resin and polycarbonate
- · Case color: Black
- Weight: About 1 kg or less
- Dimension UT351 - 96 (W)  $\times$  96 (H)  $\times$  100 (depth from panel face)
- UT321 48 (W)  $\times$  96 (H)  $\times$  100 (depth from panel face)
- · Installation: Panel-mounting type. With top and bottom
- mounting hardware (1 each) Panel cutout dimensions:
- UT351  $92^{+0.8}_{-0}$  (W)  $\times$   $92^{+0.8}_{-0}$  (H) mm
- UT321  $45^{+0.6}_{-0.6}$  (W) ×  $92^{+0.8}_{-0.8}$  (H) mm Installation position: Up to 30° upward facing
- (not designed for facing downward)
- · Wiring: M3.5 screw terminals (for signal wiring and power ground wiring as well)

#### Power Supply Specifications

- Power supply: Rated voltage of 100 to 240 V AC (±10%), 50/60 Hz
- Power consumption: Max. 20 VA (8.0 W max.) • Internal fuse rating: 250 V AC, 1.6A time-lug fuse
- Data backup: Non-volatile memory (can be written to up to
- 100,000 times) Withstanding voltage

tialized; set the alarm setpoint again.

Factory-set defaults

# 6. Description of Multiple Setpoints and PID

The UT351/UT321 controllers have a maximum of four target setpoint (SP) parameters and has PID for each of these setpoints. The following shows the correspondence between the target setpoint numbers (SP.NO), target setpoints (SP), and PID parameters.

For example, if you have set "2" to the target setpoint number (SP.NO), the control parameters available are target setpoint (2.SP), proportional band (heating-side proportional band) (2.P), integral time (heating-side integral time) (2.I), derivative time (heating-side derivative time) (2.D), cooling-side proportional band (2.Pc), cooling-side integral time (2.Ic), and cooling-side derivative time (2.Dc).

To use multiple target setpoints, see the table below to check the corresponding parameters.

Target setpoint	Target	PID parameter							
number (SP.NO)	setpoint (SP)	Proportional band (heating-side proportional band)	Integral time (heating-side integral time)	Derivative time (heating-side derivative time)	Cooling-side proportional band	Cooling-side integral time	Cooling-side derivative time		
SP.NO=1	1.SP	1.P	1.1	1.D	1.Pc	1.lc	1.Dc		
SP.NO=2	2.SP	2.P	2.1	2.D	2.Pc	2.lc	2.Dc		
SP.NO=3	3.SP	3.P	3.1	3.D	3.Pc	3.lc	3.Dc		
SP.NO=4	4.SP	4.P	4.1	4.D	4.Pc	4.lc	4.Dc		

# User's Manual

Models UT351 / UT321 **Digital Indicating Controllers** with Active Color PV Display User's Manual Operations

NEW

IM 05D01D02-02E

3rd Edition: Apr. 1, 2003

YOKOGAWA 🔶 Yokogawa M&C Corporation

This manual describes key entries for operating the controller. For operations using external contact inputs, see "6. Terminal Wiring Diagrams" in Installation User's Manual . If you cannot remember how to carry out an operation during setting, press the vertice that 3 seconds. This brings you to the display (operating display) that appears at power-on.

Contents

- 1. Setting Target Setpoint (SP) 2. Performing/Canceling Auto-tuning
- 3. Setting PID Manually
- 4. Setting Alarm Setpoints
- 5. Selecting Target Setpoint Numbers (SP.NO) 6. Switching between Run and Stop
- Switching between AUTO and MAN
- 8. Manipulating the Control Output in Manual Operation 9. Troubleshooting

# NOTE

Do not use the instrument generating strong magnetic field such as radio equipment and the like near the controller. This may cause the fluctuation of the PV value.

# 1. Setting Target Setpoint (SP)

The following operating procedure describes an example of setting 120.0 to a target setpoint. In automatic operation, the controller starts control using set target setpoints.

# 2. Performing/Canceling Auto-tuning

Auto-tuning should be carried out after setting a target setpoint (SP). Make sure the controller is in automatic operation mode (AUTO) and in running state (RUN) before carrying out auto-tuning. See "7. Switching between AUTO and MAN." to change to AUTO and "6. Switching between RUN and STOP," to change to RUN.

# NOTE

When on-off control is being used, auto-tuning cannot be carried out. Moreover, do not perform auto-tuning when

- contolling any of following processes.
- Control processes with quick response such as flow control or pressure control Processes where even temporary output on/off results in inconvenience
- Processes where a large output change at control element results in inconvenience
- Processes where variations in PV may exceed an allowable range, adversely affecting product quality

# 3. Setting PID Manually

If you know the values to be set or if suitable PID constants cannot be obtained by auto-tuning, follow the procedure below

# 5. Selecting Target Setpoint Numbers (SP.NO)

The following operating procedure describes an example of changing a target setpoint number (SP.NO) from 1 to 2.

# NOTE

If a target setpoint number has been switched using contact input, when the contact input is on, that number cannot be selected by keystroke When using target setpoint ramp setting function, PV tracking works if the target setpoint number is switched.

# 6. Switching between Run and Stop

# Switching between the RUN and STOP states can be performed only using external contact input.

NOTE

When the controller is shipped from the factory, it is configured so that switching between the RUN and STOP states cannot be performed. To make the switching possible, configure the DIS setup parameter as "DIS = 4".

When the controller is stopped, input and outputs are as follows: PV input Displays PV. Control output Preset output value (factory-set default: 0%) Alarm output ON in the event of an alarm

When the controller is stopped, control output display STOP

•	
9	

increas

increase.

Is the instrument defective Totally inoperable

Check wiring on the power supply . terminals

# 7. Switching between AUTO and MAN

#### NOTE

M

If AUTO and MAN have been switched using contact input, when the contact input is ON, switching between AUTO and MAN cannot be achieved by keystroke.

# 8. Manipulating the Control Output in Manual Operation

## NOTE

output.

Control output cannot be changed if the controller is stopped. In this case, the preset output value (setup parameter PO) will be output.

A control output value is linked with a display value changed using the 👿 or 🖾 key. Note that the control output changes as displayed without requiring the wey

# Manipulating the Control Output during Heating/Cooling Control

Either of the following two displays appears when the mode is switched to MAN during heating/cooling control.

Heating-side OUT display Cooling-side OUT display 268 268 Cooling-side leating-side Symbol "H" Symbol "C" output output represents the represents the \_ % heating-side cooling-side 

 Controller behavior and control output manipulation when the dead band is positive The following is an example when the DB parameter is set at 12.4%.

If you hold down the  $\bigtriangledown$  key with the heating-side output under manipulation (i.e., cooling-side output C = 0.0%), the heating-side output (H =) decreases. Consequently, both the heating-side and cooling-side outputs change to 0.0%. If you keep the 😇 key held down longer, you enter the state of manipulating the cooling-side output, and its value begins to

\_output.\_\_

Inversely, if you hold down the A key with the cooling-side output under manipulation (i.e., heating-side output H = 0.0%), the cooling-side output ( $\overline{C}$  =) decreases. Consequently, both the heating-side and cooling-side outputs go to 0.0%. If you keep the A key held down longer, you enter the state of manipulating the heating-side output, and its value begins to

# roubleshooting

# Troubleshooting Flow

If the operating display does not appear after turning on the controller's power, follow the measures in the procedure below. If a problem appears complicated, contact our sales representative.

Take note of the parameter settings when asking the vendor for repair.

# Errors at Power On

The following table shows errors that may be detected by the fault diagnosis function when the power is turned on.

Error indication (on PV display unit)	Description of error	PV	Control output	Alarm output	Retransmission output	Communi- cation	Remedy
<i>E [] [] [</i> ] (E000)	Faulty RAM	News			00/	Otenand	
E00 /(E001)	Faulty ROM	None	0% or less or OFF	OFF	0% or less	Stopped	Faulty
£002 (E002)	System data error	0%			0%		Contact us

# ■ If a Power Failure Occurs during Operation

Momentary power failures shorter than 20 ms

The controller is not affected at all and continues normal operation.

• Power failures of 20 ms or longer

• The alarm function of the controller continues to work normally. (Alarms with the stand-by feature temporarily return to their stand-by state, however.)

· Setting parameters that have already been configured retain their settings. Auto-tuning is cancelled.

• After recovery from a power failure, control action resumes in the same mode as the one before the occurrence of the power failure. The control output begins with the preset output value.

#### Troubleshooting When the Controller Fails to Operate Correctly

If your control tasks are not successful, check the preset parameters and controller wiring before concluding the controller to be defective. The following show some examples of troubleshooting you should refer to in order to avoid the possibility of other problems.

The controller does not show the correct measured input (PV).

• The UT351/UT321 controllers have a universal input.

The type of PV input can be set/changed using the parameter "IN". At this point, the controller must be wired correctly according to the selected type of PV input. Check the wiring first if the controller fails to show the correct PV. To do this, refer to Initial Settings User's Manual

With the parameters "RH", "RL", "SDP", "SH" and "SL", it is possible to scale the input signal and change its number of decimal places. Also check that these parameters are configured correctly.

The controller does not provide any control output or the control output does not

change at all.

• The UT351/UT321 controllers have a universal output. The type of control output can be set/changed using the parameter "OT"

At this point, the controller must be wired correctly according to the selected type of control output. Check the wiring first if the controller provides no control output. To do this, refer to "6. Terminal Wiring Diagrams," in Installation User's Manual

With the parameters "OH" and "OL", it is possible to set/change the high and low limits of control output. The control output may not change at all, however, because of restrictions on these parameters. Also check the restrictions on these parameters

• The control output can only be changed when the controller is in the MAN mode. If the MAN lamp is off (i.e., the controller is in the AUTO mode), you cannot change the control output using key

#### • The control output does not change soon after the target setpoint SP has been changed.

• If this happens, check the setpoint of the parameter "C.MD". In cases where fixed-point control is selected as the PID control mode (C.MD = 1), tracking based on the I-term works to prevent the control output from changing suddenly even if the target setpoint SP is varied.

The control output therefore may appear to be working incorrectly at first; however it gradually adapts itself to the new target setpoint

0% to 100% 🗲

0% to 50%

Heating/Cooling Control (for a Heating/Cooling Controller Only)

In heating/cooling control, the controller outputs the result of computation after splitting it into heating-purpose and cooling-purpose signals. In addition, the controller can perform PID control or on-off control on the heating and cooling sides separately. When performing on-off control, set the proportional band to "0".

- The controller splits the result of computation (0 to 100%) into heating-side and cooling-side signals, as described below.
- · 0% to 50% of the computation result is presented as a 0% to 100% cooling-side
- 50% to 100% of the computation result is presented as a 0% to 100% heating-side output.

Heating/cooling control provides two methods in which either none of the heating- and outputs are p l or both of the he presented, as shown in the following figures.

 $\bullet$  Keep the ratio of the heating-side proportional band (P) to the cooling-side proportional band (Pc) equal to or below 5. • If neither the heating side nor the cooling side is performing on-off control, setting the integral time (I or Ic) of one side to "0" results in the Integral Time parameters of both sides being set to "OFF",

irrespective of the integral time setting of the other side.

#### Cycle Time

A cycle time can only be set if the type of control output is time proportional PID relay output or time proportional voltage pulse output.

A cycle time refers to one period consisting of on- and off-state time lengths. The ratio of the on-state time to the off-state time differs according to the value of the control output. The figure on the right shows on-to-off time ratios of the control output when the cycle time is set to 10 seconds. Setting a shorter cycle time allows the controller to perform elaborate control at short time intervals. This significantly reduces the on- and off-state times, however it shortens the service life of a relay.

Relay's Behavior when Cycle Time = 10 sec For 50% of Control Output 10 sec 10 sec

Cvcle time

Off

Cycle time

For 20% of Control Output 10 sec On-state duration: 2 sec Off-state duration: 8 sec On-state duration: 5 sec On-state duration: 8 sec Off-state duration: 5 sec Off-state duration: 2 sec

# User's Manual

# Models UT351 / UT321 Digital Indicating Controllers with Active Color PV Display User's Manual Setting/Explanation of Active Color PV Dislay

IM 05D01D12-04E

This manual describes the PV display color changing function "Active Color PV Display."

Carry out setings according to the following procedures after referring to "Functions of Active Color PV Display" on the back of this manual. Use "Parameter Map" of Parameters User's Manual to understand the required parameters. If you cannot remember how to carry out an operation during setting, press the required parameters at power-on. The UT321 is identical to the UT351 in items of front panel operation.

# Setting the PV display color changing function "Active Color PV Display"

The following operating procedure describes an example of changing PV color mode (factory-set default: Fixed in red mode) to Link to alarm 1 mode.

Parameter Symbol	Name of Parameter	Setting Range	Initial Value
PLid	PV color mode	<ul> <li>0: Fixed in green</li> <li>1: Fixed in red</li> <li>2: Link to alarm 1 (Alarm OFF:green, Alarm ON: red)</li> <li>3: Link to alarm 1 (Alarm OFF:red, Alarm ON:green)</li> <li>4: Link to alarm 1 and 2 (Alarm OFF:green, Alarm ON:green)</li> <li>5: Link to alarm 1 and 2 (Alarm OFF:red, Alarm ON:green)</li> <li>6: PV limit (Within PV range:green, Out of range:green)</li> <li>8: SP deviation (Within deviation:green, Out of deviation:green)</li> <li>9: SP deviation (Within deviation:red, Out of deviation:green)</li> </ul>	1

# Setting the High Limit and Low limit for PV Color change

The following operating procedure describes an example of changing PV display color by linking to PV. Set High limit and Low limit for PV color change. Setting for both of High limit and Low limit is required.

Parameter Symbol	Name of Parameter	Setting Range	Initial Value
<b><i>P</i>[[H</b> (PCCH)	High limit for PV color change	When PCMC (PV color mode parameter) = 6 or 7: -100.0 to 100.0 % of PV input range.	When PCMD = 6 or 7: PCCH:100.0 %, PCCL:0.0 % When PCMD = 8 or 9:
	Low limit for PV color change	When PCMC (PV color mode parameter) = 8 or 9: -100.0 to 100.0 % of PV input range span.	PCCH and PCCL:1.0 %

IM 05D01D12-04E 3rd Edition : Apr. 1, 2003

#### Functions of Active Color PV Display

This part describes the functions of "Active Color PV Display." PV display color is changed by the following four actions.

PV display is selectable from red-to-green or green-to-red changing action, or fixed color.

Link to alarm 1 mode (when PCMD = 2, 3) (Setting example-1)

Link to alarm 1 and 2 mode (when PCMD = 4, 5) is the same. When either of the alarms occurs, the display color is changed.

SP deviaton mode (when PCMD = 8, 9) (Setting example-2)

PV limit mode (when PCMD = 6, 7) (Setting example-3)

Fixed color mode (when PCMD = 0, 1) (Setting example-4)

# High limit for PV color change parameter "PCCH" = 10°C PV : red PV : green PV : red PV : red PV : red

#### Setting Example-4 : Fixed in Red or Green

Set the PV display color or Fixed in green mode, Setting of Fixed to red mode is also possible. Setting parameter PCMD (PV color mode parameter) = 0

#### External RJC

10°00

45°C

Setpoint

SP=50°C

External RJC is not a compensation function built in a controller but a compensation function working outside the controller.

External RJC is used when input is thermocouple, and RJC=OFF.

Using External RJC makes the accuracy of RJC higher and shortens the compensating wire.

Parameter Symbol	Name of Parameter	Setting Range	Initial Value
ErdE	External RJC setpoint	-50.0 to 50.0°C, -58.0 to 122.0°F For thermocouple input, temperature compensation value outside the controller can be set.	0.0°C 32.0°F
