Setup Procedure
UTAdvanced Quick Setting
(Controlling Furnace Temperature with a Solid State Relay)

Foreword

Overview
This is an example of wiring and settings using the UTAdvanced Quick Setting function for "temperature control in an electric furnace with a solid state relay." For more details, see the user's manual.

Relevant models
Standard models of the UT32A, UT35A, UT52A, and UT55A.

System

Wiring
Settings
To set PID control, thermocouple type K (range 0.0 to 500.0°C), and voltage pulse output control, set the following parameters.

1. Select the desired parameter with the UP or DOWN key
2. Press SET/ENTER (the setting value blinks)
3. Change the setting with the UP or DOWN key
4. Press SET/ENTER to set the new value (the setting value stops blinking but remains bright)

Redoing the Quick Setting
Once functions are configured with the Quick Setting, the Quick Setting function will not appear after you restart. However, you can redo the Quick Setting by following the procedure below.

1. Set the Quick Setting parameter QSM to ON, and re-engage power
2. Set the PV input type parameter IN to OFF, and re-engage power
3. Press SET/ENTER to accept the "YES" option.
   Quick Setting starts
4. First, the control type parameter CNT appears.
   Set CNT (control type) to PID (initial value).
5. OFF is displayed for IN (the PV input type).
6. Set IN (PV input type) to thermocouple type K3.
   (K3 = -200.0 to 500.0°C)
7. Set UNIT (PV input unit) to C: Celsius (initial value)
6. Set RH (maximum value of PV input range) to 500.00°C (the initial value).

7. Set RL (minimum value of PV input range) to 0.0°C (the initial value).

8. Set OT (output type selection) to 00.01: OUT terminal (voltage pulse).

9. Set CT (control output cycle time) to 1.0 second.

10. Finally, EXIT is displayed. Select YES and press SET/ENTER to complete the basic function setup and return to the operating screen. Or, you can select NO to continue with the Quick Setting.
