PH450 Analyzer
Programming Custom Buffer Tables

1.) Click on the settings icon (wrench)

2.) Using either the scroll key or by clicking directly on the diamond next to Commissioning, select it.

3.) Next, select the diamond next to Measurement Setup
4.) Depending on what your analyzer is set up to measure, the Measurement screen will look differently. If your analyzer is set up to measure pH only, continue to Step #5. If your analyzer is set up to measure pH + ORP, Proceed to Step #5a. If your analyzer is set up to measure pH + rh, Proceed to Step #5b.

5.) Select the diamond next to Calibration Settings, and Proceed to Step #7.

a.) pH + ORP, Select the diamond next to Calibration Settings, Proceed to Step #6

b.) pH + rh, Select the diamond next to Calibration Settings, Proceed to Step #6a
6.) Select the diamond next to pH settings, proceed to Step #7

7.) Select the diamond next to Buffers

- Zero and Slope units
- Limits and timing
- Buffers (select set)
- Zero / Slope / ITP

Use this menu if you want to manually overwrite the pH calibration results.
8.) Next, choose the Free Programable option

9.) Depending on which buffers you will be using in your application, click on the diamond next to the User defined buffer that needs to be changed. User defined Buffer 1, is the buffer table for pH 4.01; user defined Buffer 2, is the buffer table for pH 6.87; and user defined Buffer 3, is the buffer table for pH 9.18. For this example we will choose to change the values within the User Defined Buffer 2, pH 6.87, because this is the most commonly chosen table to change values to reflect pH 7.0.

10.) Select the diamond next to Enter Values
11.) Click on each pH value next to the temperature, in order to enter customer pH value for the particular given temperature value. In order to use this feature the customer must have a pH for each given temperature value in 5 degree increments from 0°C-80°C. Click enter when finished, to return to original Buffer Table screen.

<table>
<thead>
<tr>
<th>Temperature</th>
<th>pH Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 °C</td>
<td>6.98 pH</td>
</tr>
<tr>
<td>5 °C</td>
<td>6.95 pH</td>
</tr>
<tr>
<td>10 °C</td>
<td>6.92 pH</td>
</tr>
<tr>
<td>15 °C</td>
<td>6.90 pH</td>
</tr>
<tr>
<td>20 °C</td>
<td>6.88 pH</td>
</tr>
<tr>
<td>25 °C</td>
<td>6.87 pH</td>
</tr>
<tr>
<td>30 °C</td>
<td>6.85 pH</td>
</tr>
</tbody>
</table>

* = mandatory
12.) Once the pH values for the temperatures 0ºC-30ºC have been changed, click on the diamond next the the Next to precede to the next page of the table. Note: You do not have to change all of the values, only the ones that are stated mandatory.

13.) If you choose to fill out the pH values for 35ºC-65ºC do so in the same manner as described above in step #11. Once the pH values for the temperatures 35ºC-65ºC that you wish to change have been changed, click on the diamond next the the Next to precede to the next page of the table.

14.) If you choose to fill out the pH values for 70ºC-80ºC do so in the same manner as described above in step #11. Once the pH values for the temperatures 70ºC-80ºC that you wish to change have been changed, click on the diamond next the the Finish to return to the original User defined 2 Buffer screen.
15.) Next select **YES** under Check Values on the original User Defined 2 Buffer screen. This check is only looking to make sure that the mandatory values are completed. If NO Errors are found the screen should reveal results. However, if a mandatory field was missed the screen would show the error. With that being said, pay extra attention to make sure that all values entered are entered in correctly. Since this is a free programable option, the system will take any data that is entered.
16.) If you want to change another buffer table, click the Back Arrow to return to the User Defined Screen and follow steps 9-15.

Otherwise click on the home icon (the house), to remain to the main page.

17.) Now when you choose to automatic calibrate the unit will be using user defined pH Buffer.
Appendix: If at any point you would like to reset your analyzer back to factory default buffer tables, you can do so by following the steps below.

1.) Click on the settings icon (wrench)

2.) Using either the scroll key or by clicking directly on the diamond next to Commissioning, select it.

3.) Select Advanced Set up
4.) Select the diamond next to Defaults

5.) Choose to Load Factory Default Settings.

6.) Once the system has been restored the unit will automatically go back to the main home page.
